> if the radio is not well connected to the logging system.
>
I don't understand this comment - really the only thing I can see missing
out on while looking for mults is the band map - you're not talking about
being connected to the cluster and the ability to click on calls in the
band map to QSY, are you?

> Ok, I sound to serious, don't take me wrong, but this need attention
> because the ATS limitations while operating at this level of complexity,
> make things hard to solve.
>
Definitely, the ATS rig is limited in a multi-band contest...but it is a
capable rig, and we can still have a lot of fun with an all-ATS team! I
hope we'll have a Puerto Rico station on one of the teams! ;-)

9585. MTR Android and PSK/RTTY

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-22 23:26:59 UTC
From: Wayne
Topic: 9585 Message: 9585

Hi all,

I know that the MTR and other AT rigs, being CW rigs, will not accept SSB based AFSK digital modes, but Pocketdigi gets around this problem. My challenge is that I have an android device, which will obviously not run Pocketdigi. Is anyone aware of efforts to either port it to Android or a separate Android effort for either RTTY and/or PSK?

The last topic I found on this forum still contemplated trying to get a PocketPC device, but this is now a dead platform. Many of us would have either an idevice or an Android device.

The thing I like about this type of contest or sprint is there wouldn't be any computer to computer contacts. The ATS group is hand sent code and logging pretty much! That would probably eliminate many contesters!!

I started set up of the ATS-2 on the back deck with my EndFedz 10/20/40 five minutes after the contest started. The rig was powered by the six internal AAA batteries left over from field day. First contact was W0CH at about 00:23.

Total of only 4 contacts made, all on twenty. Tried 40, and changed out the batteries, but didn't even hear any on 40 at my West Montana QTH. I love this little rig. Perfect for portable operations, even if it is just the back deck.

IF you're operating Single Operator (either one or two rigs), you MAY NOT use DX Clusters nor the Reverse Beacon Skimmers. Using such op aids moves you to Multi-Op, which eliminates you from being a part of a team..

Ability to utilize 15 through 80 would make a later ATS-3b or ATS-4 the "best" rig, but much of the activity (on recent NAQP's, at least) has been on 40 and 20. Sunspots are more favorable, of course, so one might add quite a few mults on 15. 80 is frequently noisy even after dark during the summer time. Even with the MTR, you could set one for 15 and 80, and another for 20 and 40 metres (or some other combo

Dale:

If you want to be considered single op, which is a requirement for being on a team, you must be the only operator, but you may listen to as many rigs simultaneously as you wish.. You may NOT transmit two signals at once, but many contesters use "single op, two radios" (SO2R) so they can listen on one band, and try to pick up multipliers on another band. They split the audio - one rig on the left ear, the other on the right ear. I've never tried it, but some folks think it's the "cat's meow."

There's no mention of SO2R in the rules, so I'd assume it's permitted. For single operator stations, there's no limit on the number of band changes you may have in the contest. There IS a limit for Multi-Two operation - don't ask me why.

You may switch radios at any time. I think you said you had five or more of the rigs designed by KD1JV, so you could run each for a portion of the contest.

May we count you in for a team?

Hi Hank, I'd like to, don't have any issues' with SO2R... if I am well enough rested, that sometimes works. For this, I'd likely stay withjust 4... I only have 9 of his designs, but I don't have 9 decent antennas, I have four, maybe 5.. depends on the prop princess.Sure, count me in... that should be a lot of fun... can we keep each other jazzed up with emails in the middle? Not spotting.. that wouldn't be good... but just.. simple things like.. what's your rate now.. are you doing any good S&P? heard you on XX a few minutes ago, where'd the band go?would that work?As long as the team doesn't get unhappy if I run.. on a good band... rather than S&P... and I can use a puter for logging?Just so I don't slip up, can you keep me reminded, you know, which contest, when.. Thank you, this should be a blast...

9595. QST QST QST Team members needed for NAQP (CW) August 4/5

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-24 19:17:11 UTC
From: Hank Greeb
Topic: 9552 Message: 9595

A few of us have decided that we'd partake of the North American QSO party (CW) "en-masse" with rigs which were designed by Steve, KD1JV. This event is a "medium size" contest, with 100 watts maximum power, so QRPers will only be at a 13 dB disadvantage instead of -23dB for those contests which involve a "full gallon" category. Bands are 160 thru 10 metres, though most activity recently has been on 80 thru 20 metres. This year it runs from1800Z August 4 to 0600Z August 5, 2012 (First full weekend in August).

The rigs which Steve designed include the AT-Sprint series (AT-Sprint, AT-Sprint-2, AT-Sprint 3, 3a, 3b, AT-Sprint 4, Mountain Top Radio (MTR), and several more. Dale, WC7S says he has 9 versions of rigs made by Steve.

Rules for the NAQP are at http://www.ncjweb.com/naqprules.php

Anyway, I'm in the process soliciting suckers..... errr. volunteers, who have one or more of this kind of rig, and who would be willing to "give it the olde college try" at the NAQP.

So far, for "AT-Sprint Team #1" we have WC7S, AA4GA, and me (N8XX). A "full team" is 5 operators, so we're looking for at least 2 more suckers.... errr, volunteers, to round out the first team. If we have more suckers.... errr, volunteers, we may enter as many teams as we have volunteers to fill them.

Note: You needn't be a die hard contest op, you needn't put in a full 10 hours (i.e. "part timers" are fine). There will be plenty of entrants to the contest, so you shouldn't run out of contacts.

Please advise if you're available, an apologies to whomever I missed.

9604. Rotary encoder kit for ATS radios - shipping and delivery

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-25 12:57:03 UTC
From: Petr
Topic: 9604 Message: 9604

Hello folks,

according to last talk to Miroslav (Rotary encoder kit father) there are still coming some orders/payment with improper kit prices. As I even found on the internet few of the kits for sale for the higher price and I decided to re-post the original message from Miroslav to avoid mismatches...

"Hello,
I would like to inform you that the kits of rotary encoders for ATS are ready. The price remains the same 25 USD for one kit. The shipping cost is 5 USD for one kit, 6 USD for two kits and 7 USD for three wordwide. You can send the payment to my Paypal account diy4funatgmaildotcom.

Please put the version of your ATS into the payment note, because I have two different firmware for ATS-3 and ATS-4. Slightly modified and improved s/w version is dedicated for ATS-4 now.

If you want to send the kit to different address than you have in your Paypal account, please let me know either in payment note nor in email.

Thank you.
Best regards
Miroslav"

I hope that it will help You.

I would say Altoids tin...the MTR is designed to fit one. Steve has hiked
thousands of miles with an ATS rig in an Altoids box and says they hold up
fine. You could look for a fancy tin like I've got, I think it's
relatively polished:
http://1.bp.blogspot.com/-Ui29ymKIZEo/T6iYaByeR-I/AAAAAAAAAfE/pZRX6G6Eiko/s1600/IMAG0197.jpg

American Morse has a heavier duty box that is nice, especially for the ATS
rigs with band modules, so it may not be appropriate for the MTR, not sure.
Plus, he's been out of stock for a while: http://americanmorse.com/aa1.htm

I think there are some clear-topped Altoids-esque cases out there as well -
they may be a little beefier, but I haven't done an A-B comparison. Not
sure where you get those...

The American-Morse case is heavier and will allow you to sit on it, or walk on it if you just must.Much easier to make holes in, although I haven't figured out a real good way of making square holes yet. Any ideas?

I would say Altoids tin...the MTR is designed to fit one. Steve has hiked thousands of miles with an ATS rig in an Altoids box and says they hold up fine. You could look for a fancy tin like I've got, I think it's relatively polished: http://1.bp.blogspot.com/-Ui29ymKIZEo/T6iYaByeR-I/AAAAAAAAAfE/pZRX6G6Eiko/s1600/IMAG0197.jpg

American Morse has a heavier duty box that is nice, especially for the ATS rigs with band modules, so it may not be appropriate for the MTR, not sure. Plus, he's been out of stock for a while: http://americanmorse.com/aa1.htm

I think there are some clear-topped Altoids-esque cases out there as well - they may be a little beefier, but I haven't done an A-B comparison. Not sure where you get those...

Not square holes (I don't use the display on my ATS3b), but for the round
holes in Altoids tins, I've been relatively successful using a grinder bit
on my Dremel after placing a pilot hole.

Just FWIW.

The square hole is easy enough IF you get a tiny jewler's saw. This uses a tinsy blade.

I drill a center hole, and cut the diagonals, then fold back the triangles making a square hole with no jagged edges.

Also, instead of grinding pilot holes larger, I simply push a nail punch into the hole to enlargen. makes for rounded edges to the round hole.

Would anyone be interested in a custom plastic enclosure? I've been hacking on a 3D Printer since the beginning of the year and have it dialed in pretty well, and I've become skilled enough with OpenSCAD to design most anything I need pretty quickly. Though I don't have an MTR, I do have a couple of ATS3s, one unbuilt, which I could prototype a bit with. I can currently print with ABS or polylactide (working on polycarbonate) ..

John, I wondered if anyone was looking at this option as I think it raises amazing possibilities for enclosures for these radios. I imagine that they would be fairly robust? Do keep us/me posted on your progress.

9615. ESD mats portable set for safe soldering

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-25 16:49:19 UTC
From: Petr
Topic: 9615 Message: 9615

Hi all,

I would like to share my experiences with ESD mats for safe, ESD protective soldering as it can help to others. I looked for long time on the eBay and other shops for possibility to purchase small portable ESD mats including the cables to connect for same el. potential or directly to common ground.
All mats I found were big and expensive or small but expensive or small, not high quality and expensive etc.

Requested parameters were: two layers, oil, grease and solvent resistant, high temp resistant, acid proof and knife cut proof material.

After long time I returned back to Czech market where I found the company where they has exactly what I looked for but unfortunately the mats are too big. Standard size is 80cm x 160cm for high price dedicated for professional industrial usage. So I tried to call them and they promised to cut it for me to preffered size 40x60cm and install the cables and bananas for ground connection. We also reached after some phone calls excellent price. Total price is finaly $25 including all h/w.

Parameters:
- thickness: 2mm
- RTG = 10^6 ☐ 10^8

ESD Rubber Mats have two layers; the top one is a blue static dissipative rubber layer laminated to a black conductive rubber bottom layer. Surface resistivity of the top layer is 106 ☐ 108 and bottom layer is 105 ☐ 106. This ESD Rubber material offers excellent resistance to oil, grease and most common solvent. These ESD Rubber Mats are very light compared to our single layer and three layer mats. Temperature resistance to 2000F.

The link is over here:
http://kitman.eprodavac.cz/prenosne-esd-pracoviste-sada-18/

Do not worry about the Czech language of the items description in the e-shop.

If You would like to get this ESD mats then let me know I am ready to help You with purchaisng and shipping to you worldwide.

Hope it will help to some of You as same as to me safe soldering in the kitchen property...

9616. QST QST QST UPDATE - Team members needed for NAQP (CW) August 4/5

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-25 18:39:03 UTC
From: Hank Greeb
Topic: 9552 Message: 9616

UPDATE: We now have four suckers... errr. volunteers for the "AT-Sprint Team #1". The latest sucker... errr, volunteer is Arthur NS7E. We're looking for (at the very least) one more operator/station to fill this first team. So far, the roster is NS7E, WC7S, AA4GA, and me (N8XX). A team may include up to 5 members, and, remember, we may have as many teams as we have operators to fill them.

A bit of redundancy - We're looking for operators who have at least one rig designed by Steve, KD1JV, such as the AT-Sprint series (AT-Sprint, AT-Sprint-2, AT-Sprint 3, 3a, 3b, AT-Sprint 4), the Portable Field Radio (PFR), Mountain Top Radio (MTR), and several more. The NAQP uses 160 thru 10 metres (No 60 metres nor WARC Bands). Most activity recently has been on 80 thru 20 metres. This year the contests runs from 1800Z August 4 to 0600Z August 5, 2012 (First full weekend in August).

Rules for the NAQP are at http://www.ncjweb.com/naqprules.php

Note: You needn't be a die hard contest op, you needn't put in a full 10 hours (i.e. "part timers" are fine). There will be plenty of entrants to the contest, so you shouldn't run out of contacts.

Please advise if you're available.

Hey Dale and the Group:
I make the square holes by starting with a drilled hole then working it out to the corners with a small nibbler.
I ran across the one I have at Rad Shack, but I am sure there is better ones to be had from hardware suppliers!
Some touch up with a small file usually gets them good enough?
I sure like the look of Fred's cut and folded holes! I have a can or two I am gonna try that on to see if I can make it work!

Thank you Fellows, Great ideas, and lots too. On the one hand, my nibbler is too big.. I'll keep looking for a smaller one. The suggestion of a Jeweller's saw, was interesting, and while checking that out, it finally dawned on me that that, is what I used to know a variety of at least.. as a coping saw. Ok.. sure it's a bit different.. but the idea is still the same. The saw blades are different than I remember tho, in that the teeth are much more suited to metal. Very good. Thanks, I can see cleaner looking and better square holes have a future here.

John :

For those of us that are "metal working challenged" this would be awesome.
I have an ATS-3A that I would love have a nice enclosure for. I am
also thinking about ordering an MTR in the next round so I would be in the same boat
for that.

One possible case, that is intrigueing.. is a clear solid plastic acrylic case. Solid, transparent, and quite usable. It seems there should be something around that would be usable that way.

John :

For those of us that are "metal working challenged" this would be awesome.

I have an ATS-3A that I would love have a nice enclosure for. I am

also thinking about ordering an MTR in the next round so I would be in the same boat

for that.

Does anyone know if there are dimensioned drawings of the boards anywhere,
with locations of the switches, connectors, display, etc?
I may have to build up my 3B and measure stuff ...

For semi transparent cases, take a look at Bob, AD7BP's MTR build. He used a
Hammond 1591BTBU transparent blue case.

how about drilling a starter hold and using a square file? or drilling a starter hole, then your dremel to cut diagonal slots and fold back the extra material?

I would say Altoids tin...the MTR is designed to fit one. Steve has hiked thousands of miles with an ATS rig in an Altoids box and says they hold up fine. You could look for a fancy tin like I've got, I think it's relatively polished: http://1.bp.blogspot.com/-Ui29ymKIZEo/T6iYaByeR-I/AAAAAAAAAfE/pZRX6G6Eiko/s1600/IMAG0197.jpg

American Morse has a heavier duty box that is nice, especially for the ATS rigs with band modules, so it may not be appropriate for the MTR, not sure. Plus, he's been out of stock for a while: http://americanmorse.com/aa1.htm

I think there are some clear-topped Altoids-esque cases out there as well - they may be a little beefier, but I haven't done an A-B comparison. Not sure where you get those...

I have enclosed many qrp rigs in clear plastic cases. Pieces were cut with a table saw and glued with super glue. Hinges were obtained from model airplane hobby shops. Took them to ham meets and clubs to show them off. However.... if you plan to operate rockmites, small wonder, and similar rigs be aware that BCI eats them up in unshielded boxes. The MTR and ATS rigs seem to be fairly immune, just be aware that it could be a problem.

Hi all,

as I got few emails with questions if it is possible to buy the ESD mats about which I talked in last post and ship them overseas so I am sharing the informaion here again to all...

Yes, I am ready to help with that. I can order them and pay on the e-shop localy. I will re-pack and make the all admin for shipping it to anybody overseas.

The price is just $25 for complete high quality ESD mat including the cables and connection/gnd points as You can see in the link. For payment to me Paypal is ok.

Just drop me an email and I will send You quickly the shipping cost and total. It should not be excessive I guess.

My best regards,

73 - Petr, OK1RP

Anyone hear of the whereabouts of KD1JV?

I know he was planning an extended trip after the Daytown Minivention. I thunk he said he was going to "Real Mountains" along the Continental Divide Trail, but that may be faulty memory. There was some concern expressed earlier about possibly being near some of the forest fires in Coloradio, but, again, that seemed to be speculation.

I'm just curious and mildly concerned of health an welfare of Steve.

Haven't heard anything from Steve. Fires have pretty well died out here in western Montana were the Continental Divide Trail is located. Quite a bit of lightning today, fires may start up again.
I expect that Steve will surface before long.

Tnx Wendell:

Sounds like he is "really getting away from it all." Last time he did an extended trip on the Appalachian Trail he did an occasional blog. I remember reading "slow goin."

I have a brother who lives in Fort Collins, CO. He's been keeping me informed of the fires in Colorado. Wild time this year, for sure.

I am alive and well, thank you. My trip ended a little earlier than expected and I've been home for a couple of weeks. You can read about my adventure and view some photos at http://www.trailjournals.com/entry.cfm?trailname=13144

I'm not ready to go back to work yet, so will be heading over to Vermont to start hiking the Long Trail in a few days. See ya in September.

Hi Steve,

Nice to hear some news from you.
I read your journal with great interest about both the trails and group dynamic.
My current main activity here is around tourism, I act as a guide sometime.
Groups are tough sometime, girls group tougher.
When you are in front of a family group for example, you have some kind of hierarchy that makes things easier for the "external element" (the guide, a "guest member"...) but with groups of friends, not.
My own experience tell me girls groups are tougher because they have a great quality (from the group point of view) : they don't let the "internal problems" break the group. Instead of that, they put all the charges on someone else, namely the guide or the guest member.
When some element of a group of boys disagree, they will speak loud, one will go its own way for a few hours/days and they will eventually meet later.
The same often goes for some couple or families where all are adults (three grown up sisters with their husbands/kids for example).
I've never seen that with girls only.

Now about the MTR.
I am having some spare time and enjoying the assembly of the kit.
Many people here already know it but this is my first ATS/MTR : Great electronic design, great component quality, great physical design... could not be better I think, even throwing more money in this project.
Even if everything is provided and the manual gives all the recommendations, I think this is definitely not a SMD beginner kit but right the one I wanted now.
I should end the assembly in a few days (my kids will soon come back from their grandparents farm so not so much quiet spare time).
Then will start the longer and harder work : the finishings and casing...
No rush anyway since 20 and 30m are not good and I am not expecting good condx for daytime QRP before october.
http://xv4y.radioclub.asia/category/ham-radio/materiel/mtr-materiel/

Thanks for the great kits you provide.
73,
Yan.

I have a built, NOT in a box, 40M/20M MTR for sale. Works fine, has updated yellow dot micro. Measured 3.7 W out 40M and 3.2 W on 20M
@9.1V. Has all connectors attached, BNC for antenna. SN 132.
Nice clean construction job. $100 + $5 for shipping. I think Priority Small box is about $5. Not making anything off this. Rig is excess to my needs since I already have an ATS-4b. Earliest date/time email will get it. PayPal ok.

9645. QST QST QST UPDATE - Team members still being solicited for NAQP (CW) August 4/5

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-30 17:38:11 UTC
From: Hank Greeb
Topic: 9645 Message: 9645

UPDATE: We now have one full team of five suckers... errr. volunteers for the "AT-Sprint Team #1". The latest sucker... errr, volunteer is Doc, K0EVZ. While this rounds out the first team, the NAQP Rules allow for an unlimited number of teams. And, occasionally, personal or business commitment interferes with "the best laid plans of mice and men." So, I'm still looking for additional suckers... errr, volunteers who would like to be a part of this (motley{?}) crew. If we have six volunteers, we'll break into two teams of 3, if we have 7, we'll have one team of 4, another of 3, et. cetera. If we have 20 volunteers, we will enter 4 teams of five. So, please don't be bashful. You needn't be a die hard contest op, you needn't put in a full 10 hours (i.e. "part timers" are fine). There will be plenty of entrants to the contest, so you shouldn't run out of contacts.

The roster for Team # 1 is N0EVZ, NS7E, WC7S, AA4GA, and me (N8XX).

As a reminder - We're looking for operators who have at least one rig designed by Steve, KD1JV, such as the AT-Sprint series (AT-Sprint, AT-Sprint-2, AT-Sprint 3, 3a, 3b, AT-Sprint 4), the Portable Field Radio (PFR), Mountain Top Radio (MTR), and several more. The NAQP uses 160 thru 10 metres (No 60 metres nor WARC Bands). Most activity recently has been on 80 thru 20 metres. We'll be competing mainly with 100 watt ops - there will be a few "practicing" with their "full gallon" stations, but they won't be in the competition. This year the contests runs from 1800Z August 4 to 0600Z August 5, 2012 (First full weekend in August).

Rules for the NAQP are at http://www.ncjweb.com/naqprules.php

Please advise if you're available. I'd like for us to put on "a good old college try" in this event, and show the "big boys" what QRP can do. Personally, I never cease to be amazed what 5 watts to a modest antenna can do in such competition.

9650. ESD mats portable set for safe soldering - shipping cost

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-31 09:45:36 UTC
From: Petr
Topic: 9650 Message: 9650

Hello,

upon many requests I decided to share over here the shipping cost and totals for 1pc/2pcs of the ESD mats sets:

1pc of ESD mat portable set

Economy mail service (6-8weeks) worldwide: $13 shipping / $38 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)
Priority mail service (3-4weeks) worldwide: $17 shipping / $42 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)

2pc of ESD mats portable sets

Economy mail service (6-8weeks) worldwide: $19 shipping / $69 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)
Priority mail service (3-4weeks) worldwide: $23 shipping / $73 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)

*the mats including the all h/w will be rolled up, wraped and packed carefully into the bubble wrap envelope.

Payment

Use the Paypal payment to: nostalgia.radio@...
Please mention in the comment the mail service choice.

Shipping

After receiving the payment I will order the batch of mats sets. Delivery to my QTH according to last phone calls to supplier is 2-3days.
Immediately after I will check them, re-pack upon requests, fill the customs paperwork and will shipp to each of You.
Each payment will be confirmed by separate email to You as same as the shipment of the package including the tracking number and link to tracking web page.

My best regards,

73 - Petr, OK1RP

9653. Re: ESD mats portable set for safe soldering - test

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-31 16:24:24 UTC
From: Petr
Topic: 9650 Message: 9653

Hi all,

today I got my ESD mat from the supplier so I decided to make few tests and share it with You to provide You as much as possible technical information and specs...before decission for ordering it.

The size of mat is 40x60cm as described.
The tickness is 2mm as described (2-layers).

I tested several oils, greases and different solvents and mat survived without any damages.
I tested the flare-up point and it seems to be higher than 1000 C which is corresponding to almost 2000 F. (I was limited by temp sensors and thermometer over here)
I tested the burning thru temperature and it survived 450 C for 2mins which is corresponding to 850 F. (I was limited by my soldering station, hi)
I tested the max of the temp without any noticeable damage of the top layer. It survived 200 C for 2mins which is corresponding to 400 F.
Finaly I tried to cut it using standard knife and make the hole thru using drill and it proved very high resistance.

All these tests results are so great that I am really happy with this new ESD mat and I am sure that it will make great job (for that price) and help a lot to all of You who ordered it.

Steve really enjoyed your trail journal! Have a good hike on the Long Trail.

BTW I enjoyed using the ATS-4 on the Flight of the Bumblebees last weekend from Lovettsville VA.

So as you may have saw, I got an MTR kit the other day and I finished it (2 qsos down on 20m!!!) Very cool radio. It has the updated chip with the yellow dots. I built it for 40 and 20 but for some reason it defaulted to 80 and 20 so my switches only go between 80 and 20. How do I get it on 40? Did I miss something in the instructions?

that is determined by the band resistors, R3 and R4, from your description, look real close at the soldering and values of R4.Good Luck,

The Mountain Top Radio (MTR) was/is a limited production kit.
"Probably" there will be another run of kits offered when Steve, KD1JV,
gets back from an extended hike.

Sometimes you'll see a kit for sale on this list and/or QRP-L. If you
see one for sale and want it, you should respond quickly because they go
rapidly. Price was around $100 if memory serveth correct.

It's essentialy a two band version of the AT-Sprint, with two band
modules installed in the radio.

Hi Tom

By some reason, the last firmware published or loaded from Steve, has a band selecting code error and this cause this kind of problem. My MTR, was assembled for 30m / 20m band and after installing the new chip it start telling me that the bands are 40m and 20m.

Easy fix, you need to flash it with a firmware re-coded by Australian ham radio. Can't remember his name and I have the firmware on my laptop not here with this tablet. The bad new is that you need do few things and probably buy the board needed to connect the MTR to the computer for this task.

You can find more info on the the file folders on the Yahoo groups site. Please double check that your resistors on band select position, R3 and R4 are correct. R4 equal 47k (473)for 40m band. I guess your problem is the firmware, but check.

Good luck,

Milton A Riutort

Hi,

I am currently assembly the through hole parts of my MTR kit.
One of the T30-2 cores is broken in 4 parts.
I am not sure if it was during the shipping as I have not seen it during the first visual inspection but I must admit this time I have not make a complete part inventory...

My question is : Is it possible to repair it with cyanoacrylate glue ?
I still have to look in my junk box I have not one. The fact is I am colorblind (not 100%) and I need really good day light to be sure of the colors.
We are still under a typhoon weather and I don't even remember having seen the sun last week.

Thanks for your help and advices.

Steve will be happy to send a new toroid, but he's on a hike right now.
Perhaps someone else on this reflector has a spare of the right
mix/size. I'd NOT try to repair the thing, because you can't get the
parts close enough to each other NOT disrupt the magnetic field.

Hi Hamk,

Thanks for your comment.
However no need to send one. Yesterday I went through the SoftRock RXTX part list and since I built the kit for 30/20/17m I should have 2 T30-2 left the lower bands possibility.
I have not checked the junk box yet but there is no reason they are not there.

73,
Yan.

Update: got the MTR on 40m last night, took a bit longer than I had planned since I live in a no PC house! Did manage to get VMware to recognize the TI board and flashing the new firmware was easy enough after that. First QSO on 40 was with a station /P in MI state park somewhere. I am really smitten with this radio. I think everybody should have one!

I'll be in the NAQP CW contest this weekend with my MTR on the AT_Sprint team so keep your ears open for me.

9671. Last Call, volunteers for AT-Sprint Team members, NAQP, August 4/5

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-03 14:57:28 UTC
From: Hank Greeb
Topic: 9671 Message: 9671

WE now have the following suckers, errrr, volunteers for "AT-Sprint" teams for the North American QSO Party CW (NAQP) this coming Saturday. The event starts at 1800Z Saturday, and runs until 0600Z Sunday.

The members so far are: NS7E, W0EA, AA4GA, N6OSB. WC7S. N8XX

K0EVZ had to bow out for personal reasons. We will miss you Doc, and understand that other obligations get in the way of hamming from time to time.

Full details of NAQP are at http://www.ncjweb.com/naqprules.php

We have room for as many suckers, errr, volunteers as can have their arms (or legs) twisted to join us..

As I said before, the only requirement is that you have, and agree to use, any of the several rigs designed by Steven Weber, KD1JV (AT-Sprint series, Mountain Top Radio, Portable Field Radio, etc.). You need NOT operate the full 10 hours allowed (but give it the "olde college try" if you're part time).

I'll wait until tomorrow (Saturday) at 1200Z (8 a.m. EDT) for suckers, errrr.... volunteers. Please let me know your availability.

72/73 de n8xx Hg

Thanks, Doc:

Send your log, in whatever (text or paper) form you have it, to me.
I'll massage it into a Cabrillo file and upload it to the NA Sprint
contest group. You won't be an "official" member of the AT-Sprinters -
we had to enter those before the contest, but any "help" with the
AT-Sprint group will be appreciated in the overall club listing.

Our thoughts and prayers are with you in your wife's struggle with cancer.

9674. Re: ATS3b.1 15-20m output power droop

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-06 02:46:19 UTC
From: mdpowell1977
Topic: 7476 Message: 9674

I'm still struggling with this and have a bit more data.

With a 12 V supply, power output on 40m and 30m is a solid steady 5 W (or more) under extended keydown.

20m, 17m, and 15m start at 5, 5, and 3.7W but droop to 1.8, 1.6, and 1.2 W after 7, 5, and 1.5 seconds of keydown respectively.

Measurements are being taken from an o-scope connected to the TX wire on the rig with the output being into a good 50-ohm BNC terminator connected directly to the rig's BNC connector with no coax.

An additional finding is that the 5V regulator output is drooping as well, as measured from the 100uF C58. Output is steady at 5 V on other bands and when not transmitting. On 20m, 17m, and 15m, it droops to 3.7V, 3.6V, and 3.1V at the same rate as the output power. Power from this supply ultimately drives the NOR gates that drive the BS-170 finals, which makes me wonder if the reduced voltage is causing the power droop or a symptom of some sort. The input voltage drops only 70 mV from 11.98 to 11.91 V under 15m keydown, so that's not the problem.

Does this bring any potential issues to mind? Thanks.

--Mike (w1ku)

9675. Re: ATS3b.1 15-20m output power droop

Yahoo group: AT_Sprint (2012 — 2013)

From: jgaffke
Topic: 7476 Message: 9675

Wow, cool problem!

Check the solder job on the regulator and the bypass
caps near the regulator on the 12v and 5v rails.
If nothing looks amiss, replace the regulator,
and perhaps those nearby caps as well.
If it still does not work, put a 10 ohm resistor in series
with the input to the regulator so you can measure the
current, and report back with your voltage measurements
across that resistor.

Yes, 3.1v at those NOR gates is probably not
turning on the BS-170's hard enough.
Those NOR gates will suck more power from the 5v rail
as the frequency goes up.

Missing caps can cause the regulator to oscillate.
You may see an oscillation if you put a scope
on the 5v rail.

The regulator will shut down if too much current goes
through it as determined by an internal temperature sensor.
That might explain the time lag. Perhaps the regulator
is not soldered down to the board well enough, so it
cannot dissipate the heat properly. Or perhaps that
internal temperature sensor is out of whack.
Or perhaps something is wrong elsewhere on the 5v rail
that is sucking more power than it should.

Good luck!
Jerry Gaffke, KE7ER

As it's quiet in here of late, I'll ask the question:

Will there be a report on how the sprint went?
Number of participants, #of contacts etc.?

It was hard going here, with the pond to cross to get to all you guys!

Hey Pete!

Yes, we'll be getting a writeup done in the next week or two - I haven't had a huge bunch of logs turned in, so I'm planning on sending out "reminders" to folks that didn't submit - so we can hopefully generate a little more interest for next time around.

It was hard going here, with the pond to cross to get to all you guys!

It works rather well, to grip so the force is along the etched line.. this works real well, right down until you need to do the last one.. then it gets a bit tuffer,I like to use a sharp edged table or chair edge to hold down the one module board and force against the other again, along the line.Good luck,

9682. MTR BFO intermittent problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-10 01:45:35 UTC
From: Yannick (XV4Y)
Topic: 9682 Message: 9682

Hi,

I have finished the mounting of my Mountain Topper Rig.
Everything went well so far and I had great pleasure mounting the rig.
The "basic" tests are ok : annunciation, LED display, keyer, audio... everything is ok.
When I go into calibration mode I have a carrier at 10MHz and looking to it with my SDR transceiver it is fairly close to 10 MHz (my SDR calibration is pretty good too).
Then yesterday evening I went into BFO setting mode. I heard a rather loud low pitch tone.
I started to play with "UP/DOWN" and then it disappeared.
I tried to restart the calibration sequence, the 10MHz at TP1 is still there so I think the DDS works ok. Still no tone and it seems no receive either.
I had a last check on the TP1 voltage while not in calibration mode (in normal mode) and it is not 0V anymore...
It was late and I gave up.

This morning I put my SDR in transmitting a 14.060 carrier to a dummy load and listening to it on the MTR.
I heard noise! Not the carrier (but did not peak the filters already) but the normal noise you have on a receiver.
I then switch to the Calibration mode so to hear the BFO tone is back! Good news.
I went thought the calibration again but while I was playing with the BT1 adjustable cap, the sound again disappeared and no receiving anymore...

I am currently checking the voltage around the mixers but found nothing strange so far.
Does one of you have an idea about what could be going on ?

Thanks for your help.
73,
Yan.

Dale and fellow ATS/MTR owners,

My rig is now working. I felt in a good mood and went straight to check TX.
I got a short (bad small coax cable) but the PA is forgiving even with 12 V.
Now I have more than 4W on 30m and 5W and 20 with 12,5V. Plenty of power for QRP.
The BANDA (30m) adjustable caps are both at limit range but I think I don't need to worry.

I just had my first QSO with JA1NUT, 4000km with 5W in the ground plane, what else can I ask for ?
Everybody here already know it but audio is good and the ergonomic great for such a little rig.
Now I have to think about a portable 20m GP that I can install at the farm...

Thanks Steve for this great rig.
73,
Yan.

NAQCC Sprint Tuesday night!

Our August sprint is this coming Tuesday evening local time (August 14, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Wednesday August 15, 0030-0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201208.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6100+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Come join us and have a real good time!

9689. New to the Group

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-12 20:42:14 UTC
From: Christopher
Topic: 9689 Message: 9689

Hello, my name is Chris Maness (KQ6UP). I have been bitten by the bug to build a small HF tranceiver for camping trips. Are these kits still available? This seems like the best compact size QRP rig that I have seen.

I teach high school chemistry in physics. I have been a ham since I was 14 years old (almost 40 now). I am also into large format photography and the great outdoors. I like to shoot 35mm when I am on my motorcycle, and 4x5" or 8x10" when I am in my jeep.

Chris

Hi Chris,

Right now there are no kits available.
Steve de KD1JV is currently on holidays and he will try to think on a new run of kits in september.
The specifications of the next kit are not known.
Steve just finished a new design (the Mountain Topper Rig) with 150 units sold in less than 24 hours I think.
Perhaps the new kit will be similar (2 bands, fitting in an Altoid sized box) or more evolved technically like the ATS-4 serie.

I personally just finished to build my MTR. It was perhaps the more demanding kit I had to assemble because almost all the components are SMD and they are all packed on small PCB area. However, it worked from the first start with just a little error from my part.
The rig by itself really is a great performer offering modern features and performance level. Once you read the manual the ergonomic is good for such a small package.
I saw the KX3 now topped the Sherwood comparison table. I don't know where the MTR would be, but we are not talking about the same price, the same weight and you cannot build a KX3 yourself (really building I mean).

If you would like to buy a kit from KD1JV, just read the e-mails coming from this list.
The list is not polluted by unrelated content and you will learn a lot about theses kits.
There are sometime secondhand kits or already assembled rigs that could came available...

73,
Yan.

9691. ATS QSO Party - last call for logs!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-13 02:29:48 UTC
From: Lee Hiers
Topic: 9691 Message: 9691

Hey folks, I've been a bit busy at work lately and haven't worked on the writeup for the ATS QSO Party as much as I'd have liked, so you've still got a chance to get your logs in.

Go check the list of received logs at http://ats-sprint.blogspot.com/p/logs-received.html and if you're not listed, get you log (just a list of QSOs with info - no special format needed) in to me ASAP!

We've got to get this one buttoned up so we can start planning the next one! ;-)

Well since Steve is on vacation, what low priced rig would you recommend building for the time being? I was looking at this rig, but I don't need SSB:

http://kd1jv.qrpradio.com/ARRLHBC/ARRL_MMR40.html

I already own a FT-817. I was looking into something that was smaller and more compact that I could run off of a solar cell and a ultra capacitor. If I want to get really alternative, I could have sterling engine run a small D.C. generator too.

Regards,
Chris Maness

If you could find a TriBander, sold by Hendricks, or a PFR-3, same source, they would be my choice. However, Doug Hendricks is dealing witha personal situation, the last check of his website was indicating a pause in shipments just now.Maybe someone has one on a shelf somewhere?

It would help to know how you define "low cost"... $50? $100? $200? Also, multiband/single band? When you say "solar cell", I assume you mean a small solar -panel-, as single cells have somehwat less than 0.5v output each. The power available from your solar panel into a supercapacitor, will determine what is realistic for rx current drain, TX output power, etc. Determining your power budget will set limits on what you can resonably expect. I don't know of anyone who has used this power combo (solar/capacitor) although many of us have used LiPo batteries (lightweight) supported by small solar panels.

It can be fun to define the terms, and let that help lead you to the answers...

~$50-$100

Also, multiband/single band?

Prob 40 & 20m

When you say "solar cell", I assume you mean a small solar -panel-, as single cells have somehwat less than 0.5v output each.

Yes, panel (cell array).

The power available from your solar panel into a supercapacitor, will determine what is realistic for rx current drain, TX output power, etc. Determining your power budget will set limits on what you can resonably expect. I don't know of anyone who has used this power combo (solar/capacitor) although many of us have used LiPo batteries (lightweight) supported by small solar panels.

I was thinking this might be a good way since I could use a small panel. Many of these rigs use so little current on receive. One would only need a temporary supply of 5W power to cover the intermittent transmit. Here is a fellow powering a QRP radio with a tiny steam generator.

Chris,

The price for the MTR was 100 USD for a 5W 2 bands rig, without the case but with any other necessary hardware in order to have a functional rig. That's topping your price range and you will need a paddle, an antenna and perhaps a antenna matching device. That's around 200 USD for a complete set ready to transmit.
I found it a real bargain giving the quality of the design, the components and the manual. You can find some stuff for a little cheaper, but without DDS, keyer and lesser overall quality.
For CW a VCXO could be a good compromise lowering the cost a lot. However, I found the design choice for the ATS/MTR series to be really good each time, covering various needs.

My opinion is that the MTR/ATS rigs are not beginner or tweaker rigs. They use a lot of integrated devices, you don't have room to work on the PCB and soldering SMD is not easy. For learning the basics of radio and trying to to build parts of a transceiver myself, I preferred my Bitx20 version 3 who is in its category also a great performer and was cheaper. i modified it with a DPLL VFO, an audio filter, and audio input/outputs for Digital modes (with a VOX).

73,
Yan.

9702. LED indicator SWR Bridge

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-15 00:54:51 UTC
From: Yannick
Topic: 9702 Message: 9702

Hi,

Having finished my MTR I am now preparing other pieces of the "go kit".
I had a look in my junk box and I think I can easily build a SWR indicator.
However I mainly see two designs and I'd like to have advices or experiences from more skilled OM.

The most famous one seems the Tayloe bridge as offered in a kit by Doug Hendricks :
http://www.qrpkits.com/swrindicator.html

But I see another popular design which seems first published in Sprat, similar but saving a toroid :
http://www.m0jha.com/about114.html (with a meter instead of the LED)
http://www.aa5tb.com/coupler.gif (included in a tuner)

Last, a really simple device that needs some work for a 5W usage :
http://home.frognet.net/~mcfadden/wd8rif/text/swr_ind.txt

I know they were many discussions about this in the group already, however I don't understand Yahoo search engine results and what I read is mostly out of context information.

I like the AA5TB design and unless someone can explain me why Dan Tayloe design is better, I think i will go this way.

Thanks for your help.
73,
Yan - XV4Y.

9703. Skeeter logs

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-15 01:14:25 UTC
From: Larry Makoski
Topic: 9703 Message: 9703

The first logs for the Skeeter Hunt held last Sunday have started to trickle in - 25 so far.

I know there were a lot of you out there operating. Don't be shy about sending your results in!

Full logs (adif and cabrillo files) are not necessary. The following is more than enough:

Name
Call
Skeeter number (if you had one)
Number of Skeeter QSOs
Number of Non- Skeeter QSOs.
Number of S/P/Cs that you worked on all bands. If you worked GA on 20 and 40 it ocunts twice, for example.
Your station class multipler:
X1 Home stations - commercial equipment
X2 Home stations - home brewed or kit built equipment
X3 Portable station - commercial equipment
X4 Portable station - home brewed or kit built equipment
And whether or not you're claiming the homebrewed key bonus of 1,000 points. Remember, the key has to have been built specifically for the Skeeter Hunt and you have to send me a picture.

All soapbox comments and phots will be posted.

Deadline for submissions is September 12th (30 days) but avoid the rush and send youe score early to w2lj@...

Thanks es 73!
Larry W2LJ

Hi Terry,

That's what I though, thanks for confirming.
However with around 5W I will have plenty of power to lighten the LED.
Using cheap germanium diodes (I have plenty of those) will also help turn it on earlier.
This afternoon I will go shopping for a fishing pole and some 50 or 100 ohms, 2W resistors.

9706. ATS-4 problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-15 13:29:20 UTC
From: A.-L. und J. Allemann
Topic: 9706 Message: 9706

Hallo
For months, my ATS 4 worked nicely, but since a few weeks, I only can operate "straight key" and the function
switch only can be used for switching off (as indicated in the manual).
Is there a possibility to reset to "paddle
mode" or could it be a bad solder connection?
I would be glad to glad to get some advice.
Thanks in advance
HB9BAB /
Jürg

Possibly a short-circuit at the paddle jack wiring? Or, a damaged or faulty jack itself. This would force the ATS-4 into straight key mode on power up. You could try disconnecting the wire to the paddle jack, and see if the problem clears.
Good luck,
Bruce, N1RX

Is this related to the following issue identified by Steve a few months ago?

" If the rig is in Straight key mode and you do a setup save, it will
remain in SK mode forever. Well, not quite forever, as you can clear it if you
want. That is done by powering the rig up with the MENU button held closed. That
will clear the options flags and the start up freq registers. Then do another
set up save. Calibration data is not affected."

Hi there:

This problem was observed on the MTR, not sure on ATS4. I mean, the problem of save the radio configuration with the straight key connected. I report this problem with mine to Steve, but really not sure the ATS4 has the same problem too. Anyway checking it again any short circuit on the key and/or key connection is not a bad idea.

Sorry, this is an MTR issue, not ATS-4 as far as I know. I was thinking MTR when I replied - senior moment!

Hallo Bruce,

mni tks for the hints!
I disconnected the wire to the paddle jack - no emprovement! no short cut in the paddle wire aswell!
So I' am still on the way to solve this problem. Any ohter suggestions?
thanks in advance.

Possibly a short-circuit at the paddle jack wiring?
Or, a damaged or faulty jack itself. This would force the ATS-4 into straight key mode on power up. You could try
disconnecting the wire to the paddle jack, and see if the problem clears.
Good luck,
Bruce, N1RX

which version of the ATS-4 do you have? first run ATS-4 with the power button on the front, or ATS-4a or 4b? I am not sure if there is a "full reset" available, which may help, if this is a firmware, not harware bug.

I am away for the next several days at our local amateur telescope makers convention www.stellafane.org so I will only be on rarely during the weekend. Perhaps some other users have some thoughts on this problem...
Good luck!,

Hallo Dale

tks fr replying.

What is the response when you short both paddles, then turn on the radio?=> Display shows QRG and voltage; permanent NF-sidetone and HF output.

What is the response when turning on the radio with no paddle
plugged in?=> Normal receive situation; no sidetone, no HF.

After disconnecting the battery for a couple minutes, then
reapplying power with a paddle plugged in, but not shorted, what does it do?=> same as above.

Can you measure the
paddle shorting, with no power applied to the radio, all the way up to the ic, both pins 13 and 14 of the MPS340? => I
mesured with my ohm-meter: no shorting in jack; up to pin 13 and 14 no shorting either.

Could it be a bad soldering
anywhere?
Meanwhile thanks for helping!

You're very welcome, Looking at not seeing the short from either paddle (dit or dah) to ground, from the jack on toward the ic... is a problem.. let me re-ask, just to make sure,I'm asking it correctly. With no power to the radio, and the paddle plugged in, Can you measure the paddle shorting to ground either the dit or the dah, when the paddle is activated ?IF that is measureable, at the jack, can you trace that action to the IC, by putting your meter probe, closer and closer to the ic, while activating the paddle.. ?Trace that way on both the dit and the dah side. What do you find?

I did measure the paddle shorting to ground either the dit or the dah, when the paddle is activated (but rig
not powered on) form the jack back to the IC (pins) and I got always a perfect shortening.

From: Dale Putnam
Topic: 9706 Message: 9720

GM Jurg, Since the short at the ic on each lead goes away when the paddle is not activated, with power off the radio. That then leads me to examine very closely the soldering around the ic.There is a possibility that the ic would respond to a reprogramming. However, soldering is certainly more likely. Particularly around U7 and U9. Many times a reflow on the ic legs of the solder, will cure issues.Good luck,

Gm Dale

I did measure the paddle shorting to ground either the dit or the dah, when the paddle is activated (but rig

not powered on) form the jack back to the IC (pins) and I got always a perfect shortening.

[AT_Sprint] Re: ATS-4 problem

Hallo Dale

tks fr replying.

What

is the response when you short both paddles, then turn on the radio?=> Display shows

QRG and voltage; permanent NF-

sidetone and HF output.

What is the response when turning on the radio with no paddle

plugged in?=> Normal receive

situation; no sidetone, no HF.

After disconnecting the battery for a couple minutes, then

reapplying power with a

paddle plugged in, but not shorted, what does it do?=> same as above.

Can you measure the

paddle shorting, with no

power applied to the radio, all the way up to the ic, both pins 13 and 14 of the MPS340? => I

mesured with my ohm-

meter: no shorting in jack; up to pin 13 and 14 no shorting either.

Could it be a bad soldering

anywhere?

Meanwhile thanks for helping!

9721. FS: HP iPAQ h4100 w/ PocketDigi

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-17 19:45:45 UTC
From: John Shadle
Topic: 9721 Message: 9721

Hi all,
I have 2 HP iPAQ h4100 PocketPC models for sale. They both have PocketDigi installed on them, as well as the Windows software that comes with these devices (Word, Excel, etc.).

Both are in great condition (no scratches on the units, etc.) with batteries that hold a charge.

Each also has a soft case for the iPAQs and a docking station with USB cable.

I'm asking $55 shipped for each, or $105 if you want both (including shipping).

Please reply off list.

Thanks!

9722. ATS4b 20 M problem: 65 MHZ

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-17 23:12:52 UTC
From: db66jy
Topic: 9722 Message: 9722

Hi
I posted about this before but still have not been able to find the problem. During the initial tests the rig worked correctly on all bands but jumped to 65 MHZ on 20 meters several times and then went back to 14 mHz. The problem then returned and now moving s6 to the 20 m position results in the display showing 65.032.861 MHZ. with a loud tone and the S meter full scale. I can vary the frequency but if I power off and on again it goes back to that same frequency

I have tried resoldering U10, U7, looked all over for shorts or bad solder connections (which is still most likely the problem?). Another ham suggested desoldering S6 to eliminate possible short from too much solder above the board, but that also did not help. The rig seems to function perfectly on all other bands.

Does anyone have any other suggestions for locating the problem?

Thanks in advance for any help or suggestions!

HI Dale

Next week, I will try to resolder the rest of the circuit; hoping that will help!
If not, I will ask Steve
(when he will be back from his walk) to reprogram the IC, because I'm not equipted to do this job.
Meanwhile thanks
again for your help and advices!

GM Jurg, Since the short at the ic on each

lead goes away when the paddle is not activated, with power off the radio. That then leads me to examine very closely

the soldering around the ic.There is a possibility that the ic would respond to a reprogramming. However, soldering
is

certainly more likely. Particularly around U7 and U9. Many times a reflow on the ic legs of the solder, will cure

issues.Good luck,

Gm

Dale

I did measure the paddle
shorting to ground either the dit or the dah, when the paddle is activated (but rig

not powered on) form the jack
back to the IC (pins) and I got always a perfect shortening.

You're very welcome, Looking

at not seeing the
short from

either paddle (dit or dah) to ground, from the jack on toward the ic... is a problem..

let me re-ask,
just to make sure,

I'm asking it correctly. With no power to the radio, and the paddle plugged in,

Can you
measure the paddle shorting

to ground either the dit or the dah, when the paddle is activated ?IF that is

measureable, at the jack, can you trace

that action to the IC, by putting your meter probe, closer and closer to
the

ic, while activating the paddle.. ?Trace

that way on both the dit and the dah side. What do you find?

Subject: AW: RE: AW:

[AT_Sprint] Re: ATS-4 problem

Hallo Dale

tks fr replying.

What

is the response when

you short both paddles, then turn on the radio?=> Display shows

QRG and voltage;
permanent NF-

sidetone and HF

output.

What is the response when turning on the radio with no paddle

plugged
in?=> Normal receive

situation;

no sidetone, no HF.

After disconnecting the battery for a couple minutes,
then

reapplying power with a

paddle

plugged in, but not shorted, what does it do?=> same as above.

Can you
measure the

paddle shorting, with no

power applied to the radio, all the way up to the ic, both pins 13 and 14
of the MPS340? => I

mesured with my ohm-

meter: no shorting in jack; up to pin 13 and 14 no shorting either.

Could it be a bad soldering

anywhere?

Meanwhile thanks for helping!

Hi all,
I have 2 HP iPAQ h4100 PocketPC models for sale. They both have
PocketDigi installed on them, as well as the Windows software that
comes with these devices (Word, Excel, etc.).

Both are in great condition (no scratches on the units, etc.) with
batteries that hold a charge.

Each also has a soft case for the iPAQs and a docking station with USB cable.

I'm asking $55 shipped for each, or $105 if you want both (including shipping).

Please reply off list.

Thanks!

9736. K6JSS/UNIO during Ohio QSO Party Saturday, August 25, 1600Z

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-23 00:57:13 UTC
From: Hank Greeb
Topic: 9736 Message: 9736

Please be advised that I'll be operating as K6JSS/UNIO from UNIOn county, Ohio near Columbus. This event starts at 1600Z August 25, and ends at 0359:59Z on August 26. (That's Saturday evening in the United States and Canada). Rules for the party can be found at http://www.ohqp.org

If you're in the contest, or hear my signal, please spot me on your favorite DX cluster, and/or QRPSPOTS.com. Note that the rules allow for use of DX Clusters, Reverse Beacon Network, QRPSpots, etc. for all categories of operation.

Unless things change, I'll be the only fixed station on from UNIOn county, so folks will like to know when/where I'm operating.

This event is part of the K6JSS State QSO Party Challenge. Details of the challenge are at the QRZ.com page for K6JSS and at http://www.qrparci.org/content/view/8407/139/

Hope to see many AT-Sprinters during the contest. If you contact me, please try to contact at least two or three others, so you won't be unique to my log.

From: Thomas Campie
Topic: 9738 Message: 9738

Reading throughout he manual it makes it pretty clear that you should not use over 12v source for the power. Does that mean I cannot use my 13.8v supply? is 12v really 12v in this case?

TJ:

Typically when KD1JV says "xx Max voltage" he means it. There's usually a diode across the output to protect from spikes in the voltage (due to SWR, etc.) and to make sure the PA transistors' max voltage isn't exceeded. Many folks talk about using a series of diodes to reduce 13.8 Volts to 12 Volts, or using a DC/DC converter to change from 13.8 to 12 volts, so "user beware!"

I generally run my AT-Sprint @ 9 VDC, where such considerations are minimal. It puts out 3 watts solid with 9VDC, which is good enough for me. :)

72/73 de n8xx Hg

p.s. Hope to meet you tomorrow after 1600Z for the Ohio QSO party. I'll be running K6JSS/UNIO to set a new QRP record for the county (there's none at present) and to partook of the K6JSS State QSO Party challenge.

Ok! I've been using my 8 cell NiMH pack at about 10.1v nominal for 4w out but wanted to put my MTR in the car so I can get some SOTA stuff on lunch at work. I'll be sure to bring the battery pack along instead of trying to run off of the car battery.

Good luck in the contest - not sure I'll have time to get on much but if I do, I'll be looking for ya.

9741. Re: [AT_Sprint] ATS4b 20 M problem: 65 MHZ

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-24 23:03:26 UTC
From: Dan Birnbaum
Topic: 9722 Message: 9741

Dale,
Thanks for your suggestions. I got off work early today and finally had time to follow them.

The R39 value is correct at 10 K and I re-flowed the solder
R43 has 3.3 volts on one side and the pin 9 side shows
80 M 2.24 V
40 M 1.65 V
30 M 0.57 V
15M 0.23 V

I'm not sure what they are supposed to be but that looks like it might be reasonable. So the MCU should then be shifting the DDS to the correct frequency? Any other ideas where to hunt next for what is causing 20 meters to jump to 65 MHZ

Thanks again for the suggestions?

On Aug 18, 2012, at 7:57 AM, Dale Putnam wrote:

>
> Hi Dan,
> A reflow after checking r39 for correct value, of the resistor, maybe in order. Then a check of the voltage on the pin 9 side of r43, when s6 is switched from band to band.

>
>
> Hi
> I posted about this before but still have not been able to find the problem. During the initial tests the rig worked correctly on all bands but jumped to 65 MHZ on 20 meters several times and then went back to 14 mHz. The problem then returned and now moving s6 to the 20 m position results in the display showing 65.032.861 MHZ. with a loud tone and the S meter full scale. I can vary the frequency but if I power off and on again it goes back to that same frequency
>
> I have tried resoldering U10, U7, looked all over for shorts or bad solder connections (which is still most likely the problem?). Another ham suggested desoldering S6 to eliminate possible short from too much solder above the board, but that also did not help. The rig seems to function perfectly on all other bands.

Topic: 9742 Message: 9742

It is a wonderful day in the life of a foxhunter!... Yep. Sky is blue, not very many clouds, the temp is 57 and rising, the breeze is too much to paint the house, and I have time to work on antennas, and scan the foxpage..... Did you see that NK6A just barely squeeeeeeeked by K4BAI for the TOP FOX... and there is only one week left..... to hunt in... and only one more log to score.. then this last week will be posted too... As it stands now tho.. with two weeks left to post... Don is on the top of the Fox Den Standings. Now how about those Hounds????WOW!... NK6A is holding the top spot for Hounds too! But there are 6 Hungry Hounds nippin and yippin at his heels.... Not nary a slip can he afford. Better come check out the excitement, and watch this coming Thursday... as the Hounds close in... and the Foxii... slip slyly through the woods.... It's going to be a 90 minutes exciting close to the season. And remember we have a no fire ban in the woods... so watch out for sparks, arcs and no flame throwers allowed, in the last hunt of the summer of 2012. Good Luck to all and to all a Good Hunt!!

Hi Tim I have the two modules.. one is done, working on the other one. I may have an AT4 here.. but not the b... I like the b.. it is the best of the series, to me. altho... the choice of 15 or 17m must be made....and that is a bit of a detractor. But... really no much at all.The rx in both the 3 or 4 are hot... the tx are no slouch... and the keying in both are almost identical...I have a winkeyer USB here.. that is really getting in the way for any of the normal keying... I am just not happy with it... would much rather use the keyers built into the 3 or 4... or the TriBander... if you're looking for a three band rig.. that is the one to get.It is a HOT rx... and great tx... knob tuning.. switch for bands.. and is a hole through kit.. Hendricks has it... nifty radio.I have one just for the FoxHunts. Pretty cool.. to.. it hasn't let me down yet... and that's comparing it with the K2 It is even pretty effective in contests too. But.. only three bands.

Tim,

You don't have to make a sacrifice on 17 or 15 meters . . . If you can give up 80 meters, you can have 40 through 15 . . . I've done it and it works great . . .

Cheers es 72 de

Mike

Dale, can you email a copy of your label please? My main concern is that the color is a decent match to the case and, if possible, the label would have the switch functions enumerated, such as:

http://groups.yahoo.com/group/AT_Sprint/photos/album/744936926/pic/475172432/view?picmode=large&mode=tn&order=ordinal&start=1&dir=asc

Thanks for your attention to this. It's been 10 weeks, so appreciate it if you could move it up the cue.

Thanks & 73,
Barry N1EU

9753. ESD mats portable set for safe soldering - all shipped

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-08-27 10:00:57 UTC
From: Petr
Topic: 9753 Message: 9753

Hello all,

Just FYI...

I would like to inform that all ordered/paid ESD mat sets has been shipped including an email confirmation and own tracking number with link to tracking website.

I hope that all will arrive safely and that You will enjoy Your new ESD tool as much as me in my home lab. Your comments will be appreciated. Hope that it will help to all of us with ESD protection during our homebrewing.

...and one more think

Yes, 1MOhm resistor to limiting the current is included in both blue coiled wires so additional grounding point with resistor is not needed.

My best regards,

73 - Petr, OK1RP

Selling my ATS-3b.1, used very little besides a two-week trip to Ontario (Pix in KB5JO photos folder). It's operational, housed in an altoids tin, all band modules. Asking $175 shipped CONUS. Paypal only.

Interested, please contact me offline.

72, Curt KB5JO

Curt:

Just wondering = Could I possibly interest you in a trade of my MFJ 9420 SSB/CB 20 Metre rig for your ATS-3b? This little 10-watt guy is excellent for both portable and fixed station use, and it really puts out quite a potent ssb signal.

And this rig has the CW adaptor built in, so it is very easy to get on in that mode.

Anyway, could I possibly interest you in such a trade, or are you looking for cash only?

73,
Doc/K0EVZ

9761. 65 Mhz on 20 meters ATS4b

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-01 23:20:51 UTC
From: Dan Birnbaum
Topic: 9761 Message: 9761

HI
I am still stumped by my ATS4b that got through its initial tests fine--- including 20 meters but now shows 65 mhz on 20 meters with all other bands working fine.

The R39 value is correct at 10 K and I re-flowed the solder there.
R43 has 3.3 volts on one side and the pin 9 side shows
80 M 2.24 V
40 M 1.65 V
30 M 0.57 V
15M 0.23 V

This looks about right. Just to be sure I tacked a resistor across the 30 M resistor to get about 10 k and the frequency jumped from 10 mhz to 65 on that band so the problem is after the band switch. Any suggestions where to look next?

Thanks

Dan
AD6JY

>

Dan,

I belive there was (or is) a bug in the program which caused that to happen. It's a rare event and I'm not sure if I ever figured out what sequence of events caused it to happen to be able to fix it. In any event, the processor will need to be re-flashed to fix the problem. You can sent it to me to do that if you like.

72, Steve KD1JV

PS - Yes, I'm finally back from hiking Vermonts Long Trail - 270 miles in 26 days :)

Hi,

I will answer to Jean-Paul in french is there are no objections...

Bonjour Jean-Paul.
Le dernier transceiver de Steve, le Mountain Topper Rig a été produit a environ 150 exemplaires tous vendus en moins de 48 heures début avril.
Steve a profité des derniers mois pour s'adonner à son autre passion (celle qui l'a conduit à concevoir les ATS et MTR) la grande randonnée en montagne.
Il est de retour chez lui depuis quelques jours, et si tout va comme il le souhaitait devrait commencer à travailler sur un nouveau transceiver.
Soyez patient et suivez les échanges sur la liste. Beaucoup de choses intéressantes y sont échangées.

Par ailleurs, d'autres transceivers conçus par Steve KD1JV (dont le PFR-3 dont vous parlez) sont toujours disponibles chez Hendricks QRP kits...

Amitiés,
Yannick.

Dear fellow QRPers,

Sorry again but I will shortly answer this one in French as it may help that some content is archived in the list.
However, I will follow this discussion in private e-mails with Jean-Paul.

Jean-Paul,

Le Mountain Topper Rig et la dernière incarnation des transceivers de KD1JV dédiés au SOTA ou à la randonnée.
C'est un "retour à la simplicité" avec un design proche des ATS-3 mais sans modules enfichables pour changer de bandes.
C'est un design moderne et performant avec DDS et micro-contrôleur pour la gestion de la fréquence, le manip électronique, les mémoires...
Le transceiver est donc bi-bandes (deux bandes avec comme maximum 14 MHz), dispose d'un seul afficheur 8-segments et délivre 5W sous 12V.
Il est très compact car tous les composants ou presque sont en CMS. Il est prévu pour être monté dans une boîte de bonbons Altoids.
Quelques photos ici :
http://xv4y.radioclub.asia/category/ham-radio/materiel/mtr-materiel/

La série précédente, celles des ATS-4 était beaucoup plus complète (afficheur LCD, multi-bandes) mais peut-être moins adapté à la vraie randonnée où chaque gramme emporté dans un sac-à-dos compte.
L'ATS-4 est relativement proche du PFR-3 mais utilise plus de CMS. Le kit était complet avec boîtier inclus.

Steve affiche les informations sur les kits qu'il propose sur la page suivante :
http://kd1jv.qrpradio.com/
Toutefois, il ne conserve pas d'archive des kits offerts et quand ceux-ci sont tous vendus, la page disparait.
Les vraies archives des documents sont sur ce présent groupe dans la sections "Fichiers".

73,
Yan.

Hi everyone. Up for sale is my QRP Base Station Accessory. I have used it very little so decided to sell and use the proceeds towards either an ATS-4 or Weber Tribander.

You can see photos of the item in the Photos area:
http://groups.yahoo.com/group/AT_Sprint/photos/album/1354932441/pic/list

I am asking $40 plus shipping and insurance from zip 94087, your choice Parcel Post or Priority Mail Medium Flat Rate box. Payment by money order. If you wish to use PayPal I would ask for another 1.5% for PayPal fees.

Please contact me off line.

I have the following radios for sale - they are all built and are working fine:

KD1JV MTR - $100

ATS-3B with modules in Altoids box (2 radios available) - $100 each

I wanted to offer these radios to the group before posting them to qth.com. Shipping to the US (not Alaska or Hawaii) at no additional cost. Thank you for the bandwidth.

I have the following radios for sale - they are all built and are working fine:

KD1JV MTR - $100

ATS-3B with modules in Altoids box (2 radios available) - $100 each

I wanted to offer these radios to the group before posting them to qth.com. Shipping to the US (not Alaska or Hawaii) at no additional cost. Thank you for the bandwidth.

Let me rephrase it. What I meant was, I can send you money through PayPal as if I owe you some money (not for goods) so that there is no service charge.

Thanks,

Chris

Hi yannick
Hi everyone
sorry for my poor language in English
You are right to write that I am a "fan" KD1JV work, which could not have admiration for all these achievements and those
distributed by the company Hendricks, and many others ...
I discovered this for some time, and I'm actually surprised the pfr3 is wonderful and easy to build.
The Mountain Topper Rig is amazing, but I think I came too late, I'm not talking about the ATS 3 b which pleases me a lot with its modules,
the two units athers bands can be selected I think ... but how to be at the right time ...
TRX can buy a ready-made, because I think the guys are very excited about all these arrangements,
and will be selling some if you can not have these kits, this is a big job and we can understand,
73s all

Dear fellow QRPers,

Sorry again but I will shortly answer this one in French as it may help that some content is archived in the list.
However, I will follow this discussion in private e-mails with Jean-Paul.

Jean-Paul,

Le Mountain Topper Rig et la dernière incarnation des transceivers de KD1JV dédiés au SOTA ou à la randonnée.
C'est un "retour à la simplicité" avec un design proche des ATS-3 mais sans modules enfichables pour changer de bandes.
C'est un design moderne et performant avec DDS et micro-contrôleur pour la gestion de la fréquence, le manip électronique, les mémoires...
Le transceiver est donc bi-bandes (deux bandes avec comme maximum 14 MHz), dispose d'un seul afficheur 8-segments et délivre 5W sous 12V.
Il est très compact car tous les composants ou presque sont en CMS. Il est prévu pour être monté dans une boîte de bonbons Altoids.
Quelques photos ici :
http://xv4y.radioclub.asia/category/ham-radio/materiel/mtr-materiel/

La série précédente, celles des ATS-4 était beaucoup plus complète (afficheur LCD, multi-bandes) mais peut-être moins adapté à la vraie randonnée où chaque gramme emporté

dans un sac-à-dos compte.
L'ATS-4 est relativement proche du PFR-3 mais utilise plus de CMS. Le kit était complet avec boîtier inclus.

Steve affiche les informations sur les kits qu'il propose sur la page suivante :
http://kd1jv.qrpradio.com/
Toutefois, il ne conserve pas d'archive des kits offerts et quand ceux-ci sont tous vendus, la page disparait.
Les vraies archives des documents sont sur ce présent groupe dans la sections "Fichiers".

Yan.

9784. First portable operation with my MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-16 03:37:37 UTC
From: Yannick (XV4Y)
Topic: 9784 Message: 9784

Hi,

Yesterday I went to my in law's farm (Soc Trang, Mekong delta) and for the first time brought my new portable set up consisting a 20/30m MTR and a "fishing-pole" ground plane with 4 radials.
I had the station running in 30 minutes (need to trim the antenna since it was first usage) but the operating time was the worst possible since it was 11 am local time.
On the equator 20m is closed at that time except for less than 1-2000km QSOs but no B or YB stations were active.
I kept calling CQ and tuning over the band but it was not before 3pm local time that I was able to hear some traffic.
Only 3 QSOs so far with VR2CM, JA5GCI and... V63MJ. The latter being a real DX (5700 km) and rare entity, I worked him just at the beginning of the pile-up but was amazed to have him in the log so easily with only 4Watts. No doubt the MTR has a clean signal since he heard me right from first call and I was not the only one calling!

Great fun! Thanks Steve for this marvelous rig. Exactly the one I needed.

More pictures and details here (in french but you can use Google Translation).
As you may notice on the picture the only negative point of the day was my W5JH paddle was broken by one of the kids...

9785. ATS4 Sidetone

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-16 15:24:07 UTC
From: WA0ITP
Topic: 9785 Message: 9785

After two recent portable outings, with lots of calling CQ, I've decided that I need to do something with the sidetone. It's a super rig, and I love it but for comfort during long sesions, I need to round off the square wave and also decrease the volume.

Looks like a place to start is with the values of R20 and C56. I'm sure Steve has spent considerable time on this so with my meager skills I may be unable to change it much, if at all. A single or 2 stage RC lowpass would probably do the trick nicely, but it doesn't look as if there's if there's room for it.

Has anyone modified theirs, or considered options to enhance the sidetone quality?

TIA for any info.

If that is a 4... then there is a r20 feeding into pin 3 of U4.. it is a 1meg, that can be changed.. to a pot.. or a different value resistor to put the level where you want it. OR.. a better fix would be to add a 10k pot to feed pin3 with the audio feeding the pot coming from r20. Then you would have a "set" it to conditions sidetone level.

9787. no sidetone on ATS-3B.1 initial bringup

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-16 18:46:26 UTC
From: scottg720
Topic: 9787 Message: 9787

I'm going through the initial bringup of an ATS-3B.1 main board and not hearing the sidetone '8' come through the speaker. I looked back through the archives and found

http://groups.yahoo.com/group/AT_Sprint/message/4024

which was very helpful. I think I've been through all suggested in this thread, but may have missed something.

It appears that the sidetone is being generated and not making it through the audio section (?).

Observations with my board:

1. on power up I hear a quick popping noise followed by a short burst of white noise, followed by an 8 on the LED display, after which the LED goes blank

2. The 5V and 3.5V regulators are working OK

3. TP1 reads 0V, R19 on the side away from TP1 reads 0V

4. There are no observable bridges on any ICs

5. On power up my scope shows an audio square wave coming out of pin 3 of U8 and it blinks an '8' in code! It also shows a lower amplitude wave form on pin 3 of U4 blinking '8', although it doesn't look like a square wave.

6. on U8 I have 5V on pins 2, 4, 10, 12, 14 and 0V on all others

7. U7 voltages are 1:1.2, 2:1.2, 3:3.5, 4:5.0, 5:3.5, 6:2.5, 7:0 8:1.7, 9:0, 10:0, 11:0, 12:0, 13:0, 14:3.5, 15:3.5, 16:0, 17:0.4, 18:0, 19:0.4, 20: 0.8

8. U3 voltages are 5V on all but pin 4 which is 0V. Voltage table in the manual says only P8 should read 5V. Is this part of the problem?

9. U4 voltages are 1:5.0, 2:0, 3:floating, 4:5.0, 5:5.0, 6:3.5. Table says P1 and P4 should be 2.2V, problem?

10. All ICs are oriented properly.

Actions taken:

1. touched up solder connections for U4, U5, U7 and U8, all components that touch U3 and U4

2. touched up solder connections for audio connector

Ideas?

tnx and 73,
Scott, K1OA

Thanks Dale,

Any thoughts on the waveform? I wonder if 2 RC filters (2 resistors and 2 caps) in series, with a cutoff of about 1kc could do both. If I could find room.

9789. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-16 20:12:40 UTC
From: NAQCC
Topic: 2848 Message: 9789

NAQCC Sprint Wednesday night!

Our September sprint is this coming Wednesday evening local time (September 19, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Thursday September 20, 0030-0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201209.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6230+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Come join us and have a real good time!

72/73 de Dave VA3RJ

Subject: Re: [AT_Sprint] ATS4 Sidetone

Thanks Dale,

Any thoughts on the waveform?
I wonder if 2 RC filters (2 resistors and 2 caps) in series, with
a cutoff of about 1kc could do both. If I could find
room.

I love this
radio stuff !

Sidetone

If that is a 4... then there is a r20 feeding into pin 3 of U4..
it is a 1meg, that can be changed.. to a pot.. or a different value resistor
to put the level where you want it. OR.. a better fix would be to
add a
10k pot to feed pin3 with the audio feeding the pot coming from r20.
Then
you would have a "set" it to conditions sidetone level.

Subject: [AT_Sprint] ATS4 Sidetone

After two recent portable outings, with lots of calling
CQ, I've
decided that I need to do something with the sidetone. It's a
super
rig, and I love it but for comfort during long sesions, I need to

round off the square wave and also decrease the volume.

Looks like
a place to start is with the values of R20 and C56. I'm
sure Steve has
spent considerable time on this so with my meager
skills I may be unable
to change it much, if at all. A single or 2
stage RC lowpass would
probably do the trick nicely, but it doesn't
look as if there's if there's
room for it.

Has anyone modified theirs, or considered options to
enhance the
sidetone quality?

TIA for any
info.

I love this radio stuff !

From: scottg720
Topic: 9787 Message: 9791

After probing around a bit with my oscope I discovered that after shorting pin 4 (gnd) on U3 directly to ground not only do I hear the sidetone '8' come through the headphones, I also hear what sounds like normal receiver hiss.

I've touched up the pin 4 solder joint a few times now but this doesn't seem to help.

Thoughts on this situation?

tnx and 73,
Scott

9792. SLQS Annual Tailgate Sale - Wed 9/19/12

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-16 18:49:59 UTC
From: dgauding
Topic: 9792 Message: 9792

Howdy,

This week! The St. Louis QRP Society is holding its annual
Tailgate Sale the evening of Wednesday, September 19, 2012. From
6:00 p.m until everyone goes home.

We will be at our usual location - the south east parking lot of Florissant Valley
Community College - just south of the new Engineering Building.

Never a charge to sell or browse. Bring gear to sell and money to buy more or better yet -
do both! Plan to talk a lot about QRP and homebrew for starters or just visit for a spell.

Brats off the grill & sodas for the hungry and thirsty. Antennas and radios available for
those wishing to get on the air or bring your ATS rig along

E-mail dgauding@sbcglobal.net for driving directions or more info.

Hope you can be with us.

Dave Gauding, NF0R FOR THE ST. LOUIS QRP SOCIETY

********** CELEBRATING our 25th Year **********

9793. ATS-4B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-16 19:32:13 UTC
From: Mike Olbrisch
Topic: 9785 Message: 9793

Howdy Dale.

Hope you are doing well.

Any chance of the ATS-4 being here by 30 Sept? We (another hiker and I) have tentatively scheduled a hike to Anthony's Nose. He has done it before, and will be my guide. I have never hiked that summit, but I can see from Google-earth that it is no hike for weaklings. This is the summit that the ATS-4 was bought for, the trek is much too rugged for my usual FT-817/Alex-Loop. Gotta be lightweight. high-speed and low-drag!

The batteries have arrived, the tuner is built, the pole is ready. All I am waiting for is the radio and some thin wire to make a 40m through 15, EFHWA.

On a sad note, my main transceiver at home has died. It was an ICOM IC-781. I have not looked inside it yet. The few places I have contacted will not work on it, too old. Something let the smoke out. It posers up, but no RX audio out the speaker jack. Headphones work. Problem is, I have no place and little time to work on it.

My son (bless his heart) said he would go 50-50 with me on a new Yaesu FTDX-5000MP. He said call it birthday and Christmas combined. We were playing with one at a ham fest a few months ago, and I mentioned that of all the radios in the fest, that was the one I liked the best. So when he heard of the demise of the 781, he called and made the offer.

I can get most of the ~$2800 (my share) by selling off the other parts of the ICOM station. I have the European model of the IC-2KL amplifier. It has 10m and 12m fully functional, new caps in the power supply, and a new DC-DC converter. That will bring $1300-$1500 itself. Alongside that is the AT-500 antenna tuner, another $350 - $500 there. The speaker will certainly bring $150+. So that is a minimum of $1800. Even if I sell the IC-781 as broken, I should still get $500 or more. So hopefully my share of the Yaesu out of my pocket will be $500 or less.

Oh-well..... it is what it is.

Anyway - I have no working HF radio in the house at the moment! Sure is quiet in the shack!!!

Mike.

that is a bad situation.. for sure.. I have a 761... and it has been just fine... hope it stays that way.. they are a bit of a mess to work on. Have you looked at the Elecraft K3? That is a fine radio.. and can be custom made to fit what you want to do with it too. I'll aim at a few days before the 30th... can't promise anything just yet, tho...

Can you measure the resistance to ground from that pin? It may need to be connected to ground? Even tho the pin is supposed to be grounded on the board, maybe the holethrough plating has come loose, or not gotten installed correctly and there isn't a ground on it.

The side tone in all the ATS rigs are software generated, Therefore, it has absolutely no relationship to the recieved signal. Unlike analog rigs, it is not possible to "listen" to your transmitted signal because the DDS is generating the transmit frequenc directly.

You do not match tones to be zero, you peak the incoming signal in the pass band of the filters, which is about 600 Hz if the BFO is adjusted properly.

As for level, the ATS-4 rigs have a side tone volume control - that's the little trim pot mounted just about the volume control, but under it's knob. The side tone from generated by the processor first drives the level control, then passes through a 1 meg and 0.1 ufd cap to further reduce it's amplitude and convert the signal to a trangluar wave. Most of the harmonics are removed by this filter. Actually, you want some harmonic content, as this makes it easier on the ears.

If your sidetone is very loud, it is possible the 0.1 cap is broken or the wrong value installed.

Steve

that has been discussed but only a little... that is something I want to look into also.. I much prefer a sine wave for a tone. This one is generated with square waves... and a multitude of them too.
mixing and carrying on... to the result that it is difficult for me to zero with someone.. close yes... zero no.
Bet you play music too, don't you?
Might as Steve, he's back now... or.. if you want, I'll check it out in a couple days.. k?

Tnx for the note Steve.

I don't see the sidetone level pot in the schematic, do I have an early version? Glad to know there's a level pot. I didnt remember it, and it will make it vy easy. I'll also check the values of the 1M/.1u filter. A sine wave sounds reasonably good so I may have a problem with that filter.

Thanks agn.

9804. 300 Zeroes Book Review - AT Sprint 3A

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-17 19:48:43 UTC
From: thwitherspoon
Topic: 9804 Message: 9804

Hi, Group,

I just posted a review of "Three Hundred Zeroes" and an interview with Dennis K1YPP: http://qrper.com

There are several photos of his AT Sprint 3A in action. If you haven't read his book, I'd encourage you to check it out.

Cheers & 72,
Thomas
K4SWL

9805. Re: no sidetone on ATS-3B.1 initial bringup

Turned out to be a bad solder joint on R7 which explains the 5V (and not 2.5V) bias I was seeing on U3.

Thanks for the reply Dale.

73,
Scott

I don't see the sidetone level pot in the schematic, do I have an early version? Glad to know there's a level pot. I

Opps, the sidetone level pot was added to the A and B versions. Tacking another .1 ufd cap acorss C50 might do the trick for you.

Hey Dale,
Well we got out butts kicked, 48 to 8!
Oh well they tried hard that's what matters most.
We have 2 grandsons on the same team, one a senior and one a junior, but
they both got to play!!!

Anyway here is the email from Steve.
I think you have a problem before you get any deeper, you have to have a
paralell port for the Ats rigs not a serial port.
The old paralell ports were the printer ports.
I am not sure how to create a paralell port on a win 7 machine?
They may have legacy cards to add them?
Let me know what you think.
My Cell number is 620-794-4101 and I am home all day tomorrow if you want
to talk about this in person. I am gonna drop my tower over and check it
out before FOX seaons opens again!!

This is from the last page of the ats 4 b manual.
Addendum:
The MPS processor and firmware:
The MPS folder on the CD contains the firmware for the processor and the
tools you would need to work on it.
These files are include for those few who like to tinker with assembly
language or a curious to see what it takes
to make this tick. There is not much program memory left to add code too,
so any changes may have to come at
the expense of deleting features already in there.
The file FET_R303 is a set up program which will install the IAR assembler
for the MPS family of processors.
(Windows) This older version of the IDE will work with the project file
supplied. A newer and more complicated
IDE is also included, FET_451. This version will require creating a new
project and configuring the options to
assemble the source code properly.
The ATS4B.s43 file is the source code and can be read with a word processor.

If you locate the MPS folder in the C drive root, once you install the IAR assembler, click on “open project” and
then the ATSB project.
If you have a PC with parallel printer port, the processor can be re-programmed using this simple interface,
plugged into the programming port pins on the ATS4 circuit board, located under the display.

Hey Johnny, Well.. some days are not quite diamonds... But learning how to try hard the next time is good too.. and trying is what really counts.. you're exactly right.oh darn.. parallel... nuts. You told me that before too.. ok.. well the other machine has an issue with getting started... so it can't be used right now... wonder.. can this be done on a windows2000 machine? It has a printer port... I have the IAR workbench on this machine.. but it doesn't have a printer port.. only usb. I'll see about putting it on the other machine... I'll be working on this tomorrow.. so thank you for your ph number... Good Luck with the tower... be careful... sometimes they seem to get hungry.. and take a small bite of what ever is close... Thank you,

> How about and overview on how to flash the chip?

> Is there a folder in the files section that explains this?

Lets start from scratch:

1. create a file folder someplace, My documents is okay place. You can name it MSP

2. down load the updated source code file ATS3B.s43 into that folder

3. From your CD, copy the file ATSB.prj (located in the MPS folder) into the folder created in step 1.

4. Instal FET_303.exe, this can be done from the CD

5. after instal is complete it will ask if you want to instal FET, leave box checked (yes, instal, that is the FET_R303u file)

6. Open IAR workbench. Programs > IAR systems > IAR ----MSP430 kickstart--- > IAR Embedded Workbench (Icon with pliers and screwdriver, 4th down in list).

7. Click on "Open file" icon in tool bar

8. Find the file ATSB.prj in the folder you moved it to and click on it.

9. A project window will open in the workspace. Open the folder named "common sources" and the ATS4B.s43 source code file name should apper. Double click on that file name and a new window with the source code should open up.

10. Plug in your programming cable to the parallel port

11. turn on the rig and connect your programming cable to the programming port on the board. No need to solder anything in. Just tilt the SIP pins at an angle to ensure a good friction fit.

12. Click on the "Debugger" icon in the tool bar. This looks like a magnifying glass on the bottom row of the tool bar on the left side of the screen.

13. C-Spy window will open and the down load should begin. A progress bar will show up and clear when the down load is complete. Close the C-Spy window when done.

If C-Spy can't find your device, an error message will come up and say

"device not found or not supported". If this occurs, you might have a wiring

error on your programming cable or didn't make good contact with the board.

I tried doing all this from a kit CD to an old PC running Win98 in order to

remember all the steps. For some reason the project and source code files

got transfered as READ ONLY, so no changes can be made to the files. That

might be able to be change using the file properties settings.

OK for the apologies, personally I was laughing so hard that I had to admire the teams involved! Never played football in high school, did marching band instead, and actually went to so many games as part of the "time off between halves" that I got really bored with it. Fascinating, how one little oddly shaped ball can cause so much work, et all, for a lot of exercise. The downhill part of it is that few people recall anything about any given game or year, yet the pro guys make tons of money!

Now, back to the ATS advice....

9814. FS: ATS-3B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-22 06:35:59 UTC
From: k6jf_radio
Topic: 9814 Message: 9814

For sale is one of of my ATS-3B rigs. It is mounted in an Altoids tin. I am selling to fund either an ATS-4 or Weber Tribander.

This unit was assembled with a soldering iron as I was not ready to try solder paste at this point. It does have a couple solder pads on top of the board under the finals missing. They lift off so easy, but are not connected to anything. There is also a lifted pad on one of the band module pins that was bypassed using a jumper. It also has a phono jack that I used for frequency display with a QBSA at one time.

All bands output at least 4w into a dummy load with an input DC voltage in the 11v range. Refer to my photos for pictures and a document listing the mods done and output power. Not long ago on a Saturday afternoon/evening I made a QSO on each of the six bands.

http://groups.yahoo.com/group/AT_Sprint/photos/album/1354932441/pic/list

I am asking $130 for the rig plus shipping (Priority Mail) and insurance. Payment can be by Money Order or PayPal. If you choose PayPay I will ask an addition 3% to cover PayPal fees.

Please contact me off line if interested.

Topic: 9818 Message: 9818

I'm starting early this time.

The North American QSO Party (NAQP) CW version will be held next year, Saturday, January 12, starting at 1800Z and ending Sunday, January 13, 0600Z. I'm looking for suckers.... errr..... volunteers for team(s) for this event.

Six of us suckers....errr, operators who had rigs designed by Steven, KD1JV, operated as a team in the August 2012 version. We had a ball! Set all sorts of new records for teams consisting of ATS, Weber Tribanders, and Mountain Top Radios. (Of course, to our knowledge, this was the first time anyone tried these rigs in this contest).

But, we REALLY did have fun. I'd like to expand the solicitation of suckers... errr...., volunteers who would like to join a team (or teams) for the upcoming January 2013 CW NAQP, who would run QRP with whatever kind of rig you prefer to use. If we have 5 rigs of the same kind, I'd make a team of those folks. If we have more than 5 rigs of the same kind, there'd be 2 (or more) teams. We can mix type of rigs for "full" teams of 5 each - it really doesn't matter.

The "interesting" part of NAQP, for the QRP op, is that it's a "semi-real" contest - not all blood and guts, and limited to 100 watts for entrants. (Folks tell me that some operators enter with "full gallons" to test their equipment, but these are a distinct minority. So, rigs like the AT-Sprint or similar with a pair of '602's or '612's for first mixer and product detectors won't suffer from large signals overwhelming the front end.

If we'd have 10 or more QRPers enter we'd set a new (recent, at least) record for QRP ops in the event.

So, if you think you might be available for part or all of the period of 1800Z, 01/12/13 to 0600Z 01/13/13 please let me know. You needn't commit completely, but I'd like to start a list of folks who "probably" could join such an endeavor.

GRR8! You actually don't need to "commit" to any particular KD1JV rig. I'd presume we'd have a mixture of KD1LV's rigs like we did in August. I see you sold your ATS-3 - didn't you?

9821. ATS-4B Help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-23 01:55:54 UTC
From: jhg40earthlinknet
Topic: 9821 Message: 9821

I Recently acquired an ATS-4B. It has no RF output on transmit that I can detect with a watt meter. When I key the rig I can hear tone on the appropriate frequency on a second receiver. However the tone is a steady tone with clicks where you would expect dits and dahs.

From that feeble description, anyone have an idea where to start looking for the problem? The keying circuit? The RF finals?

Usually the more I fix stuff the more screwed up it gets. We'll see what I can do to this thing.

I will love this thing if I can get it working. Receiver is great so far.

Thanks for any advice.

Steve-
I am having trouble with a tribander, maybe you will have suggestions.

It is set up for 80, 40, 30 meters, for band A, B, and C, respectively.

Problem: when I switch to 80, the dial flashes between 80 and 560.0, and doesn't stabilize to show the operating frequency.

I can hear signals during the split seconds between the flashes.

I have gone through the reset procedure several times, and have similar results. It appears that band selection procedure is OK, and the 40 and 30 bands seem fine. However, when I switch to 80, the problem occurs.

I hope the MEGA48 isn't faulty.

40 is working great, over 5 W output. 30 output is low, am still working on that.

I think a black bear ate someone in a tent in the Bob Marshal this summer. Lots of wild fires here, so no SOTA for me in the Gallatin Range this fall.

Dale- my toggle switch moves vertically, not horizontally. Center position is for band A, or 80m. Upper is for band b, or 40m. Lower position is for band C, or 30 m. When I assign bands for the switch positions, everything looks fine. The little switch below the dial moves through the bands OK, and the dit from the keyer functions OK.

I have reheated the solder pads, and checked the toroids and trimmer capacitor pads with a vom.

Hi Wendell, Take a close look at the resistors on the display board, R41, 42, & 43... and the connections to the wires that go to the bandswitch.It appears to be switching to the proper band, but not settling.... this may very well be a Steve ?? after all.Can you also take a very very close look, or possibly reheat pin 28 of U6? I use a X30 glass... to see, with a whole lotta light.

Dale-
I reflowed the solder on R1, R2, and R3.
Removed and reinserted U6, looks like solder has flowed from the underside of the board to the top at pin 28.
Have gone through the restart sequence at least a half dozen times. Still have the problem.

I am using a bausch and lomb variable power dissecting scope. There is room to solder and plenty of light.

Will need to think about this for a while. Sometimes solutions appear overnight.

Thanks for the help.

9828. RE: [AT_Sprint] Weber Tribander kit help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-26 21:36:16 UTC
From: Dale Putnam
Topic: 9449 Message: 9828

Hey Windell, If you want, send that to me, I'll get it going for you, and ship it back, k?All you would be out of pocket is the shipping. And that will be about 8 for Priority USPS... Dale - WC7S 5503 N. College Dr.Cheyenne, Wy, 82009 k?

Subject: RE: [AT_Sprint] Weber Tribander kit help

Dale-

I reflowed the solder on R1, R2, and R3.

Removed and reinserted U6, looks like solder has flowed from the underside

of the board to the top at pin 28.

Have gone through the restart sequence at least a half dozen times. Still

have the problem.

I am using a bausch and lomb variable power dissecting scope. There is

room to solder and plenty of light.

Will need to think about this for a while. Sometimes solutions appear

overnight.

Thanks for the help.

Wendell

9830. RE: [AT_Sprint] Weber Tribander kit help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-26 22:11:05 UTC
From: Jay
Topic: 9449 Message: 9830

Dale and Wendell,

I am following the mail on this issue. If I can help, please let me know.

Wendell's switch arrangement is similar to mine except his switch is rotated 90 degrees CW from mine. My bands are 80, 40, and 20 while Wendell's are 80, 40, and 30.

I'll continue to monitor what transpires.

Regards and 73!

Jay

9831. Re: [AT_Sprint] Weber Tribander kit help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-26 23:22:19 UTC
From: Johnny Matlock
Topic: 9449 Message: 9831

Ge guys:
This may help a little. I had a problem with undrestanding where band A was to be assigned while setting my rig up. If you read the yellow high lighted text on the top of page 14 it tells you the lowest frequecy band must be in the A posistion. I am almost sure posistion A on the switch is in the center or neutral
Followed by B at one end and then C at the other end.
After figuring this out I went back into setup and told the processor which band was where, but starting with the low band, or as on mine 80m and working my way up. My tri bander then switched fine from band to band.
Just a for what it is worth?

9833. RE: [AT_Sprint] Weber Tribander kit help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-27 00:28:15 UTC
From: Jay
Topic: 9449 Message: 9833

Johnny and the group,

The only mistake that I made in my tribander build was the wiring of the band switch. For whatever reason (simple mind that I have), I tend to believe pictures before the writing.

The first page of the tribander manual shows bands (L to R) of 40m, 30m, and 17m. Unless the switch wiring is changed from the instructions of page 14, this band order is very wrong.

After playing with my tribander (Originally, it was wrong!!!), band A is the center switch position, band B is the left switch position, and band C is the right switch position. Once I got this ordering straight, the tribander has been a happy camper ever since.

Regards,

Jay

Dale- my toggle switch moves vertically, not horizontally. Center position is for band A, or 80m. Upper is for band b, or 40m. Lower position is for band C, or 30 m. When I assign bands for the switch positions, everything looks fine. The little switch below the dial moves through the bands OK, and the dit from the keyer functions OK.

I have reheated the solder pads, and checked the toroids and trimmer capacitor pads with a vom.

And that is the only specific area or component that causes an issue, with some. Someone (likely Steve) that the photo was in error... I read that somewhere, as to the bandswitch.Attention or focus to that specific area seems to be helpful. Johnny and Jay both found the way around the issue. Oh.. and one more note... I did take only a minute or two, to see if I could get the bandswitch to go from low to high.. or high to low... and that didn't work... it may be possible if someone wants to spend a whole lotta time on it.. I don't. And.. it may not be possible.. no matter how much time is spent. Have a great day,

No Frank, you didn't lose the link, it was never published!

But, thanks to your gentle reminder, I got off my duff and put the
finishing touches on the report tonight.

Go to http://ats-sprint.blogspot.com for the write-up, and click on the
"Results" tab for details.

Thanks for participating, and look for an announcement here for the next
running of the ATS QSO Party!

Date: 2012-09-27 04:48:03 UTC
From: Lee Hiers
Topic: 9837 Message: 9837

I finally got the results published.

Highs - lots of fun with Steve Weber's rigs!

Lows - poor conditions

Thanks to all who participated, and we'll run another edition before too long - watch here on the list for an announcement!

Check out the results at http://ats-sprint.blogspot.com and click on the Results tabs for the full detail and soapbox.

9838. Re: [AT_Sprint] WTB MTR for SOTA

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-27 12:37:00 UTC
From: Randy Moore
Topic: 9832 Message: 9838

Steve,

I'll let the MTR go. Would you like to see some pictures? It's mounted in an Altoids box (of course!). Was working fine when I last used it about 2 months ago. I built it by hand-soldering the SMD's. What else would you like to know? How about $115 shipped to you. I'd like payment by PayPal, but other is possible. I'm in the process of moving, but I know where I put the MTR, and can probably ship it tomorrow if you can do PayPal today.

Just remembered that I put a couple of pictures on the Yahoo Group site. They're in the Photo section in the folder "MTR KS4L". This link might take you there:

http://groups.yahoo.com/group/AT_Sprint/photos/album/1523572069/pic/list

Let me know what you think.

Looking forward to QSOing you and the goats again soon!

73,
Randy, KS4L

9841. RE: [AT_Sprint] Weber Tribander kit help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-29 02:00:19 UTC
From: wmorrill@montana.edu
Topic: 9449 Message: 9841

Am still working on the tribander kit.... removed ICs and inserted them again to be sure no pins were folded under... wish I would have used machined pins instead of the cheap sockets...double checked the wires to be sure they were correct... reflowed most of the solder...checked for unsoldered joints and solder bridges by using a good microscope....

I checked the voltage on some of the ICs. The diagram shows the AD9834 as U8, U8 is LM386.... incorrect readings showed up on the U2 mixer, pins 5, 6, and 7 were 0V, instead of 3.9, 4.5, and 4.3, respectively. Maybe that narrows things down a bit, have to look for a short or faulty component somewhere in the circuits.

Finally, I looked at the 1K resistor that is added to the bottom of the board.... between pins 1 and 4 of U3. Well, I counted wrong, and didn't see that the pad for pin 1 is square. I had put the resistor on pin 2 and the pad below U3. Easy to make this mistake, suggest that the instructions should note that pad for pin 1 is square. Maybe this had been the source of trouble.

Thanks to everyone who is following my blunders.

Wendell

9842. Re: [AT_Sprint] Weber Tribander kit help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-09-29 02:09:36 UTC
From: Johnny Matlock
Topic: 9449 Message: 9842

Hello Wendell
I have to ask after all of this suspense, did this fix the little rig??
Thanks 73
Johnny AC0BQ

Johnny=
Sorry, still no joy. Thanks for your interest, still might need to send
it to Dale.

9844. WTB ATS-3B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-10-01 18:11:40 UTC
From: Keith Hamilton
Topic: 9844 Message: 9844

I am looking to purchase an ATS-3B in good working condition. Please email me off the list at tuner@.... Thanks! 73 Keith N8CEP

9845. Re: [AT_Sprint] Weber Tribander kit help

9846. RE: [AT_Sprint] 1st ATS QSO Party Results

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-10-02 17:16:34 UTC
From: Mike Olbrisch
Topic: 9837 Message: 9846

DO IT AGAIN?

Lee is a SOTA operator - I am going to tell him to NOT do it again until I get my ATS-4.

What do you think about that? <grin>.

Mike - KD9KC.

From: AT_Sprint@yahoogroups.com [mailto:AT_Sprint@yahoogroups.com] On Behalf Of Dale Putnam

To: AT Sprint
Subject: RE: [AT_Sprint] 1st ATS QSO Party Results

Great job, Lee... and a whole lotta fun for us all.
Thank you for all that hard work too.

What a bunch of fun was had by all..

Now the burning question.. when can we do it again???

Note to self.... charge batteries....

Subject: [AT_Sprint] 1st ATS QSO Party Results

I finally got the results published.

Highs - lots of fun with Steve Weber's rigs!

Lows - poor conditions

Thanks to all who participated, and we'll run another edition before too long - watch here on the list for an announcement!

Check out the results at http://ats-sprint.blogspot.com <http://ats-sprint.blogspot.com/> and click on the Results tabs for the full detail and soapbox.

Lee,
many thanks for organising.
Maybe next time we can have it a bit earlier so that us folks on this side of the pond don't have to stay up all night!

Anyway, apart from the poor condx I had a great time.
Luckily the weather was kind to us or the portable OP may have been called off. Even though I only logged 6 QSO's the ATS4 was still cooling down from a SOTA activation a few hours earlier when I made 30+ contacts including 2 across he pond.

If anyone is interested this was my operating location except it was pitch black!

Ok,... I'll be good.. I promise not to change rigs all over the place... how about different rigs .... on different bands? Would that be better?I was only trying to help others make more points... And if we plan an even near the Spring Equinox.. we could enjoy some mighty fine band conditions.. just like we are had at the Fall Equinox... and Winter Solstice should be pretty good for the low bands too.. Mike and others should have their radios by the next one too. See you in the next test... and even tho I'll be a year older... I'm still going to be in the Ca and Pa QSO parties too.

9851. NAQCC 8th Anniversary

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-10-05 02:26:59 UTC
From: NAQCC
Topic: 9851 Message: 9851

This coming week of October 7 through the 13th is a very special one for the North American QRP CW Club (NAQCC). That week we celebrate the 8th anniversary of the founding of the club by Tom KB3LFC (now WY3H) - President, and John K3WWP - Vice-President. We will have 10 special event stations on the air that week - one from each USA call area - with the calls N1A, N2A, N3A, N4A, N5A, N6A, N7A, N8A, N9A, N0A. The 40 operators of the calls will post their operating schedule at http://naqcc.info/n3a_complete_schedule.php so you will know when and where to look for them as you participate in our celebration.

We are offering special QSL cards and Certificates for anyone who works one or more of our special event stations. To find out how you may obtain one and/or the other, check the information contained on the page at http://naqcc.info/main_n3a.html. You must follow the informatin there EXACTLY or your request may not be fulfilled.

The operation commences at 0000Z October 7 and continues through 2359Z October 13. That is the week of our monthly sprint with which many of you reading this may already be familiar. However this month's sprint is something special as all 10 of our special event calls will be active for the full two hours. There may be some sort of award or prize to the one working the most different calls. This should make our already extremely popular sprints even more popular than usual when we normally get 175-200 participants, of whom 110-130 or so will submit logs.

The sprint is Tuesday evening October 9 at 8:30-10:30 PM EDT which converts to the more familiar Wednesday October 10 from 0030-0230Z. Hope to see you there as well as at other times during anniversary week.

Date: 2012-10-05 21:24:54 UTC
From: nz8j
Topic: 9852 Message: 9852

I have a ATS-4B that I assume doesn't have the latest firmware in it as it won't retain frequencies when powered down and back up.

I would like to hear from someone who has upgraded theirs and how hard it was to do. I don't have a computer with a parallel port so I would have to install one of those as a starter I assume.

Thanks for any help/suggestions..
Thanks
Tim

In my ATS4B, frequency is not retained during a power off and power back on ... UNLESS ... I change bands (while it is on). Just a tad quirky ;-)

Tim,

It is not hard to do at all. Steve posted a guide some time ago. I made the cable and connections one has to have and I followed the guide. All went well. No problems!

Yes, you have to have a computer with a parallel port. It means you have to find an old computer somewhere....

And yes, I simply looove my ATS-4B. Made 134 SMFF activations in the bush this summer without any kind of problems what so ever!

9857. I don't understand the keying circuitry

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-10-12 19:55:14 UTC
From: holweiderspatz
Topic: 9857 Message: 9857

I don't understand the keying circuitry. Why not simply key with one input of the 74ac02 and attach L14 directly to V+ ?

9858. Re: [AT_Sprint] I don't understand the keying circuitry

Yahoo group: AT_Sprint (2012 — 2013)

From: Hank Greeb
Topic: 9857 Message: 9858

Keying of which kind of rig? The AT-Sprint series?

The "keying" of an AT-Sprint changes the VFO frequency to that needed for receive vs that needed for transmit, so it's not just and on/off keying circuit. I haven't bothered to figure out everything it does, but, besides changing the VFO frequency it turns off parts of the receiver and turns on the transmitter and keying monitor.

It also shapes the voltage on the final MOSFETs so it ramps up and down
over a few milliseconds, to minimize keyclicks.

Hi "holweiderspatz <holweiderspatz@...>",

I don't know about which radio you're talking about.
Anyway, I think you miss the fact that you have also to turn on/off the sidetone and switch the audio.
I am no expert but from what I read, directly keying the 74AC02 also has some drawbacks. If something goes wrong the FETs could be turned on all the time long, draining a lot of current and finally dying...

73,
Yan.

From: Saad Mahaini
Topic: 9861 Message: 9861

Hello friends,

I recently purchased a ATS-4 kit that came with no documentation, so i cant tell what i have ATS-4, A or B version.

First of all, what is the real difference between those variations of the kit?

Secondly, how can i tell what kit i have?

Finally, any "words of wisdom" and "need to know" before i start building the kit?

I appreciate your feedback

Thanks

Hi Saad, Congratulations, on the buy. First, pull the board, and inspect it. Check the printed label, for an indication to which it is.There are changes on the board... the quickest way to tell is to look at the LM 386 ic. Which way is the notch or pin one indicator pointing?Pointing up... is the early 4, pointing towards the closest edge of the board is rev a, and pointing down is the rev b. If you want, I can send the proper docs for it.

If you have a ATS-4, one of the switches (ON button) mounts to the board at right angles and therefore there is a hole for it on the front edge of the case. Also, you will have a 28 pin processor chip, but the board location for it only has 20 pins.

If you have a ATS-4A, then it will say so on the top side of the board, near the center top - ATS-4a.

If you have a ATS-4B, then the ON switch will be vertical (like the A version) but the lable on the board will just say ATS-4 - I forgot to add the "b". The B also uses a 28 pin processor, but has the proper 28 pin location for it on the board.

The manuals for each version can be found in the files section of this yahoo group.

Three main differences between the -4 and -4A:

1. Moved the ON switch to top of case in "A" version (was side mounted in -4)
2. Replaced hand wound toroids in Rx input filter with RFC chokes
3. Different display used -4 used graphic display capable of displaying 4 lines of text, A version used 3 line ASCII display.
4. Added side tone level control

Differences between A and B:

1. Went back to using gaphics display like the -4
2. Added AGC volume limiting circuit.

Thanks Dale. Im going to look for the manual in the file section of the yahoo group, unless you have a better document which i will certainly appreciate a copy. I confirm I have the B kit 73 Saad N5FF

9867. How many ATS's and MT's out there ?

Yahoo group: AT_Sprint (2012 — 2013)

Hi everyone,

Would anybody know how many ATS 3's / 4's and Mountain Topper transceivers were issued/made ... ?

There are approx 1270 group members out there, who either have or would be keen to get their hands on one of these little devices.

Am looking for a Mountain Topper tx/rx.

73

Rob

Hello guys!
I am a proud owner of an ATS-3A 20 30 40 and 80 m for a few months
is it possible to sacrifice the 80 m band, which interests me less portable in nature, and
and build printed circuit board
for bands 10 12 15 or 17 m
the circuit board does not seem complicated, but it is positive pictures somewhere to
burning here?
or OM who build and sell?
I still do not know the technique, I still get the documentation and translated into
French, so my question may be silly ...
But international proverb says: ridicule does not kill
but curiosity advances ...

The 3A uses a 40 Mhz reference oscillator which will only support frequencies up to 20 meters. Even if the DDS chip could support frequencies up to 28 MHz (which it can't) 10 and 12 meters is not possible with the transmitter design for stability reasons and very, very touchy output filters. In theory, 15 or 17M opereration is is possible with the required changes in reference oscillator frequency, DDS filter and software, but is not recommened due to the layout of the output filter on the band modules, which have a bit more "blow-by" then is optimal.

The Game Warden says we can start!!!! All we have to do first is line up the Foxii... (applications are being taken on the Webpage - http://www/qrpfoxhunt.com)and set up the teams... Team captains gather your list of members... send that list with your contact email and phone number.. to me. Now all we need to do is get this accomplished soonest. That would be as soonest we can. There are some back room things that need to be done, before we can kick it off.. so.. lets gather our stuff.. and getter done!! And, are you ready? Really ready?And may be Foxii be ever in your favor!!

Hello Steve
I'm always happy to read your answers, this arrangement is very interesting but I do not understand all the operations correctly,
your answers are clear and simple.
As we succeed in finding a few of your "babies" is like winning the lottery ... HI
I had hoped to change the DCxxB up a little in the frequencies above 20 m as well, but there were also concerns ...
It's a shame because on the higher bands one single band 10, 12, 15, or 17 m would probably be very interesting, and the antenna easier.
I am looking to see if the guys make personal changes, but I do not see anything, HI, this is probably a little complicated, unfortunately.
I also sought if there was a manufacturer of these beautiful boxes DCxxB series, but I think it's over.
but this is not the issue here, I sold pfr3 and I'll watch something else in Hendricks treasures and put me on the list
that discusses this and other units that you have developed
Thank you all and 73s

Bonjour Jean Paul -

QRPKits is again offering an enclosure for the DCxxB series - it appears to be a bit larger and comes with a crystal switching board - look for "Rock Hunter" here: http://www.qrpkits.com/dcxxb.html.

I just received mine and when Doug gets me the missing parts and I get it put together I will write up something on the DC40kits user group: http://groups.yahoo.com/group/dc40kits/.

à bientôt,
Etienne, K7ATN

OK Etienne
Thank you for this great information, I'm going to watch it
So there is more space, I hope that the box is not too
great because I already it here
It is this small box built exactly DCxxB series that interested me, the TX will really in the bag with the battery and paddle ...
this is amazing
I'll register again on this list to see if it is active with guys who are a few changes.

Hello Etienne
Yes, indeed, I saw these boxes In Doug ...
But they are not sold and are only a little larger than the original
I always wonder if it is possible there have one or DC10B DC12B DC15B or DC17B or with the same case as the original ...
I may be a little "weird", but on these small units that are in the pocket, I'm almost convinced that it would sell in a kit,
it out 1 W and a little more ... and they are complete with keyer circuit ... the price is reasonable.

9881. Flash of controller

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-10-27 03:05:00 UTC
From: Dale Putnam
Topic: 9881 Message: 9881

Are there step by step instructions of the flash process for the AT4, 4a, 4b? Or is that contained in the basic instructions from IAR?The files section has the files for each.
Thank you,

--... ...--
Dale - WC7S in Wy

Hi Dale
I have this from my files - I'll look for other folks inputs but I would
think Steve's note below would be the same
Cheers, Trevor (I'm pullin'for ya 8^)...)
****
****

Maybe you need to start from scratch. This the procedure for the lastest
IAR
version. Earlier ones use pretty much the same sets and settings.

File > NEW > Workspace (workspace clears)

Project > Create new project > click OK. --- enter a name for the project
as the "save as" file name (ATS4something) > click Save

Right click on project name in "Files" window, in pop up, hover over "Add"
then click "Add files" in pop up, select ATS4ND.s43 as the file to add and
save.

The source file will now be loaded into the work space window.

Tool bar: Project > Options

General Options ----- Device >select MSP430F1232
Linker ----------Check "Override default program entry" ---check
"defined by application"
Debugger ----------select "FET debugger"
FET Debugger --------select TI LPT

Everything should be now set up. You should be able to click the "assemble"
icon in the tool bar and have no error messages. Then you can click on the
"download and debug" icon and it should download.

At least it did for me, starting as a blank workspace.

Good luck!

Dale.... I am sending through the reflector because for about 30 days now my direct E-mails are not getting through or something.

I have been asked to guide a hike for a reporter and photographer in a 5-summit assault in mid-November. These are the same guys I was guide for that ended up being this article.
http://www.tpwmagazine.com/archive/2009/aug/ed_1/index.phtml

Any chance of the ATS-4 being ready a little before that so I can integrate it to the rest of my gear and carry it along?

Hoping you get this - and thanks.

Mike - KD9KC.

From: g4efe
Topic: 9885 Message: 9885

Hello folks - Just joined the group. I've been a life-long fan of QRP and would love to own one of the MTRs. Unfortunately I do not now have the ability to cope with SMDs so I'm wondering if anyone has a built MTR they would like to sell on to a loving,appreciative home! Boxed or not: it's not a problem, but it has to be fully functional. If you're in the USA, I have a contact over there who is happy to receive it on my behalf. I can pay with PayPal.

Thanks very much - Martin, G4EFE

9886. Tribander BFO Cal

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-10-27 17:32:17 UTC
From: k1thp
Topic: 9886 Message: 9886

I have just built a tribander and made it through the first Cal to set up the bands. I proceeded to the BFO cal and am stumped. I cannot hear a calibration tone. I hear if noise and the background changes as the BFO carrier passes thru the if passband but there is no test signal to generate the beat note. This leaves me dead in the water... Help.

Either the BFO isn't working or there is a problem (short) some where in the signal path between the 1st mixer and product detector or the DDS signal isn't getting to the 1st mixer. This is where it's really nice to have a Scope, as it would take about 2 mintutes to find were the problem is.

Pin 6 of the SA612's would be a good place to start. One should have the DDS
LO on it and the other the BFO oscillator signal.

As always:
1. Check voltages to see if thier in the correct ball park.
2. Check to see if oscillators are working
3. Trace the signals and see if thier going where they are suppost to.

Steve

Steve, here is what I have found so far. U1 pin 6 shows 21.4K to gnd. U8 pin 19 to gnd is 140 Ohms. Outout of filter measured at C47 reads 136 Ohms to gnd. With power ON, the BFO is working. U7 is making 3.3V.
U11 output is good 60 MHz sine wave. There is no output at U8, pin 19. The DDS is not working.

Well then, you need to take a close look at the soldering to the DDS chip and it's associated parts to see if some thing didn't get soldered. Laying a piece of solder wick across the pins of the DDS chip and touching the soldering iron to the wick to heat is up can often fix soldering problems to the DDS chip.

Also check the data lines from the processor to the DDS chip, if it's not getting data, it won't work.

U8 was the problem. The pin 1 thru 10 side is badly skewed on the board pads. I used a small wood dowel and poked the pins as I listened to the headphones. When I pushed down on the entire chip the rig came to life and died when I removed the pressure. I did a close visual exam with my visor and then pushed down on pin 10. The rig came back to life. I removed power and hit pin 10 with the soldering station iron with fine tip and some new solder and it's like it never happened. Receiver is very hot on all bands but I need to finish the alignment procedure.
Thanks Steve,
Dave

I'd probably buy one too just for the heck of it. I've built 2 now but
they're too fun to stop :) Maybe one for 80 and 30m

When I saw Steve at the local hamfest a couple weeks ago, he indicated there may be another run of MTRs. He is currently working on a redesign/improvement of another multiband rig, sold by QRPkits.com...
Stay tuned.

I think I'll wait until after the new year to do more MTR kits. I've been debating if I should have a box made for it like the ATS-4's. I probably should.

After having done no less than 132 SMFF activations out in the bush this summer, riding my bike to each and everyone of them, I still think that the ATS-4B is the ultimate /P-rig. At least for me, I would rather see an improved ATS-4 type rig (if that is possible) than than another MTR.

Would it be possible for those of mus who built the original MTR to get a new enclosure when they are available or will the enclosure be limited to the number of new MTR kits? I am less than thrilled with my butchered up Altoids tin.

+1 for me also, Dave. I'd like to see a larger run of enclosures that could also accept the existing MTR rigs out there. Even if I had to get on a pre-order list, so that Steve could guage the size of the run. He wouldn't want to have to order more cases than needed, but the prices do drop the bigger the run. A run of cases for the ATS3Bs would be welcome by many also, I'd bet.

A couple of people have asked me that question recently and I have neglected to answer - sorry about that.

Well, I was having some trouble getting it to work the way I wanted it to, other things came up and there didn't seem like there was a whole lot of interest in it anyway, so is kinda just sitting here in limbo. Then there is a minor problem of how the heck to mount the daughter board - the best I could think of is using some double sided tape over some of the IC's on the main board.

But what really put an end to the efforts was after playing with it for a while, it seemed to be more gimmic than useful. I hate to disapoint those of you who might have been hoping for this, but it is unlikely I will persue it farther.

Doug isn't going to like me saying this, but to end pointless speculation - we're adding a rotary encoder for tuning. Whether this is actually an improvement or not is yet to be seen, but too many die hards want a knob to be ignored.

I like using Altoids boxes. I also built my battery pack into one to match the MTR aside from color. My 3B is also in an Altoids tin. It's all beat up, but the radio still works fb, as new.

The Altoids seem to hold up well.

Hi Steve

Put me down for one of whatever is the next batch of rigs! I do a lot of SOTA activating in Scotland. The PFR3 is my main rig for this. Would love to have an ATS-4 type rig or a MTR.

Thanks for the great rigs. Will probably get one of the new Hendricks kits as well when it's out. Like others on this group I just love building the rigs!

Subject: [AT_Sprint] Re: Second run of MTR kit ?

Hi Steve

?

Put me down for one of whatever is the next batch of rigs! I do a lot of SOTA activating in Scotland. The PFR3 is my main rig for this. Would love to have an ATS-4 type rig or a MTR.

Thanks for the great rigs. Will probably get one of the new Hendricks kits as well when it's out. Like others on this group I just love building the rigs!

?

72

Hi folks - I'm new to the list, and posted a request for an MTR a week or so ago (no luck so far, BTW). I see the last several posts have been along the lines of 'Please put me down for an MTR'. Is this the mechanism to reserve one?

If so, please put me down for 1 MTR!

Or did I get the wrong end of the stick??

Hi,

Well this is just my own opinion, but if Steve follows the same procedure than last time, he does not like to take pre-orders or lists.
Once everything is ready, he will announce to the list that its time to order and you will have a few days to post your request.
But don't worry as he will explain things clearly for sure. I just think now is a bit early and he must be busy with other projects.
I think he does not like to give commitments for things he is not sure to do 100%, and this is a good manner. So if he is not sure about the availability date or the enclosure availability (and thus the price) he does not announce it.

However, I think expressing interest is always good because it helps him to decide on how to do things the best.

The MTR is a great rig and everyone that will have one should enjoy building and operating it.

73,
Yan.

Hello Steve
Hello to all
I try to follow all the email exchanges and understand what is current (which is done or what will happen in the future)
I think I should understand that Steve is not a production unit by itself, it does so for his own pleasure, and it is nicely bombarded with requests
for these cute little toys, it's probably nice to feel useful to ham radio community who are passionate about building and QRP QSO,
but it can be a little scary ...
If you have time to show on one page history of small units with their cameras and then future projects?
I see that you know all this very well, but I'm a little lost, there is a lot of information on the net,
but not that abstract pictures on some pages in PDF into one document with one line for each unit expliquation
And what can still be achieved and what will happen more.
I do not know if there is somewhere the design of printed circuit boards of old platforms and if a manufacturer can do?
I always try to imagine a unit DCXXB for the higher bands, I have read the instructions in this wonderful little kit 1W
is an interesting project, but a little difficult, I have not seen on the list of guys concerned.
Here
I was talkative as a magpie! , But I can wait two weeks for an answer, I'm never in a hurry ... H. I.

73s all

Dear Steve,

I've been lurking here just hoping for the opportunity to someday
acquire aMTR or ATS.
I have greatly enjoyed and used my very early-issue PFR3 a great deal.
Therefore, please mark me down for an MTR + Case.
Thank you. I live in anticipation!

Steve-

Just for the count I plan to pick up an MTR/Case the day they"re available. Have been patiently waiting, and SOO glad you're willing to do another MTR run--plus a case!

I've got an ATS rotary encoder kit I plan to try with the MTR (Petr sent me the ATS-4 and ATS-3 files to play with).

From: n1rx
Topic: 9959 Message: 9959

Just to be clear, before expectations get too high. There is no "list" for people to get on to reserve any of Steve's projects. There never has been. It is good to express interest, so he can gauge interest. But- he has never kept a list of names or call signs for -any- project run he has been preparing. It's just too much work, and not something he cares to do.

So, if you want to send a "me too" post, that's fine. Just do not expect it to reserve a place in line for anything. The only way to get in on an upcoming run (if any) is to watch the email list, and wait for an announcement from Steve that says he is close to accepting orders. Then continue to watch for specific instructions. (Then, of course, follow those instructions). That is the way it has always worked, and I expect will in the future.

Steve will correct me if I am worng on this.

72/73,
Bruce N1RX

Jean Paul;

Your one point, of Steve's "cute little toys" can be misconstrued, and in fact, were it not for him and engineers like him forming up these "toys", our exotic hobby of radio and all it is capable of would rely on whatever an Asian or other nationality felt would make for a nice sales gimmick for children. I never thought I'd see the day when the finest tube-type circuits would be displaced by semiconductors, then shrunk down until only a few specialists can come up with an item which might be used for the ham radio community.
Due to the need for parts that experimenters use to build their own ideas, I now receive real, paper-type magazines that list parts for setting up just such circuits, thus we can keep building our "toys" and get future generations to enjoy ideas that were considered items for the odd types of kids, not "football stars". My early teen years were when I started reading about radio, and as I went through high school, I endured some pretty bad taunting by guys who had NO idea of what made music come out of a broadcast radio! These days, those guys are grandfathers who buy "toys" for their grandchildren which have tiny earphones that plug into your ears, and they enjoy whatever form of entertainment they please, from a shirt pocket size of AM/FM battery powered radio that can even warn them of impending lethal storms!
Personally, I'll keep looking for the item that I can put a microdot of solder on, then call CQ to enjoy making contact with another enthusiast in a far away place!
Our next big hurdle isn't how tiny a rig is, it's simply being able to set up the antenna for it that some non-thinking type would object to, make us take "that eyesore piece of wire" down. Not so odd, there are "security cops" who got their badges after a foreign religious group did a very hideous act and killed a lot of people. We constantly battle someone, so I'm glad that Steve keeps on performing his wonders!

Have a fine day, I'm QRT for a couple of days, then there is much work to do at this QTH, as lame as I am with aging tine arthritis!

Let the flames burn high! Anyone to contribute strong winds to fan them?

I personally think Steve's "toys" are quite remarkable, so maybe we should throw more flames on the gasoline, and start a real flame war about Mr. Weber's excellent designs.

Now, all sick humor aside, I think it doesn't matter if what we call the output of Steve's excellent design efforts! I have an original AT-Sprint, circa 2003, in excellent working order, which performed very well during the August NA-QSO Party - a "real" contest. For a writeup of what Steve's rigs can do under "real" contest conditions, get hold of a copy of the November/December issue National Contest Journal, available from ARRL very soon! (pardon the blatantly commercial plug!)

I personally am amazed at Steve's contribution to our Amateur Radio Service! Keep up the great work!

Hello Gil
I did not understand everything ... I'm sorry, and I think some of my words are not included either ...
We must understand the idea more than words.
"I am as you slide with aging arthritis tine" then that I understood, and my wife too! , H. I.
Ahh, "small toys" so this must be understood in a simple way: it is for us, we are small players, I feel like a child see on the achievements of Steve,
I am a fan, I know the technical level of Steve, and I am amazed sometimes agrees to answer some questions on some sites ...
it really is a great opportunity for us ... you understand the nuance I think.
I already assembled and welded a pfr3 and some others, and my home made mount are very very ordinary side that these kits,
we learn a lot by building and trying to understand the schemas is a lot of luck and a great help,
because it is also the modern technology with surface components, and it is rare now for achievements as complete,
it is simply a chance to build it

Steve,

I think making up extra boxes for the MTR is a great idea. Every time I try to drill an Altoids box I wind up putting the holes in the wrong place. I try to justify it as "air cooling" the finals.

9969. Latest project - dual band (80/160) rig

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-02 18:52:49 UTC
From: Steven
Topic: 9969 Message: 9969

Okay, here's what I have been working on recently and is almost, but not quite finished. A 80/160 dual band rig with Direct conversion receiver and a DDS/PLL hybrd VFO using all through hole parts.

The DDS is a low frequency (219 kHz) signal produced by software and is used to tune an R/C VCO operating at 28 MHz and then divided down to the desired frequency.

The Direct conversion Rx is a high dynamic range type with no input tuning, other than the transmitter LPF.

The tranmsitter is my classic BS170 design, but with a variable PA supply built in so the power output can be adjusted.

Although the VCO operates at 28 MHz, operating above 40M probably wouldn't be a good idea and will not be tested.

Operation below 160 M, like the 500 kHz band should be possible.

The rig includes a LCD frequency read out, built in keyer and rotary tuning.

For some more info on the design see http://kd1jv.qrpradio.com/SDDCTR/SDDCTR.htm

I'm thinking of doing a very limited run of 50 kits for this, I imagine these would go quickly? I might be able to have these ready for sale by the end of the month. As for price, I haven't figured that out yet, but I would guess no more then $75.00

My vote would be for an ATS4 (or 5) with a non-detente, encoder tuning knob. The fact that the ATS4 covers 4 bands in a small package makes it ideal for most any ionospheric conditions.

If my ATS4 had a built-in, smooth tuning tune knob that I could grab my ultra-portable operation solution would be complete. I would be one happy camper (or hiker).

Hi Steve

I know there is no list for this or any other of your offerings - but if you want to judge demand, I'm up for one of these.

9979. Working Altoids Tins

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-02 23:58:34 UTC
From: WA0ITP
Topic: 9979 Message: 9979

I recommend not drilling Altoids or other small thin tins. It's dangerous in my opinion, is waay to much work, and usually produces unsatisfactory results. Brad point or sheet metal bits do the best job, but it's difficult to back up and hold the the tins properly. I've even tried filling them with water and placed them in the freezer overnight, then drilled down into the ice.

IMHO it's far better to punch the tins instead. Here's a tutorial on that process. I hope it helps encourage the use of this simple, safe, and easy method.. http://www.wa0itp.com/altoids_tutorial.pdf

| Steve,
|
| I think making up extra boxes for the MTR is a great idea. Every time I try to drill an Altoids box I wind up putting the holes in the wrong place. I try to justify it as "air cooling" the finals.

Subject: [AT_Sprint] Latest project - dual band (80/160) rig

| Okay, here's what I have been working on recently and is almost, but
not quite finished. A 80/160 dual band rig with Direct conversion
receiver and a DDS/PLL hybrd VFO using all through hole parts.
|
| The DDS is a low frequency (219 kHz) signal produced by software and
is used to tune an R/C VCO operating at 28 MHz and then divided down
to the desired frequency.
|
| The Direct conversion Rx is a high dynamic range type with no input
tuning, other than the transmitter LPF.
|
| The tranmsitter is my classic BS170 design, but with a variable PA
supply built in so the power output can be adjusted.
|
| Although the VCO operates at 28 MHz, operating above 40M probably
wouldn't be a good idea and will not be tested.
|
| Operation below 160 M, like the 500 kHz band should be possible.
|
| The rig includes a LCD frequency read out, built in keyer and rotary
tuning.
|
| For some more info on the design see
http://kd1jv.qrpradio.com/SDDCTR/SDDCTR.htm
|
| I'm thinking of doing a very limited run of 50 kits for this, I
imagine these would go quickly? I might be able to have these ready
for sale by the end of the month. As for price, I haven't figured that
out yet, but I would guess no more then $75.00

9983. Re: MTR or ATS4B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-03 02:49:41 UTC
From: radio_kx0r
Topic: 9964 Message: 9983

All,

If you want a knob and more features, the KX1 is nice. But the ATS rigs have a better receiver, more power out, are smaller and lighter, and are much more efficient. I almost never use my KX1 any more... I always grab the ATS-3B.

I got to try a KX3 recently, took it to the same site I used for the Bumblebee event this summer, and it blew me away with its performance and features - but it's big, heavy, and relatively battery-hungry. If you want all that nice stuff, get one.

The ATS rigs fill the need for a rig you can carry in a pack when you've already got too much gear, and for some of us, maybe we're getting too old to carry what we carried when we were 25 or 30.

I took my ATS-3B to several remote, high backcountry lakes in the Mount Zirkel Wilderness of northern CO this fall, put up big, high loop antennas - both horizontal and vertical - and all I had to do was choose a clear frequency, call CQ once or twice, and ragchew. The buttons are a little frustrating, but I think that Direct Frequency Entry (DFE) helps move around the band - like when you start out at 14.060 and then decide to listen to 14.010, etc.

Backpacking is so weight sensitive that I can't really face taking a much larger rig in for 8 or 9 miles of rough trails, some over 11,000 feet, up near the Divide where the air is thin and I need some energy left over to set up camp, catch fish, and get the big antenna up before dark - and I'm already carrying about as much fishing gear as radio gear. SOTA on high peaks - similar issues. This summer I stopped carrying feedline - it isn't worth the hassle - just wire-feed the antenna, whether unbalanced or balanced.

I'm afraid Steve is right - to compromise the ATS rigs with more features and more stuff defeats the purpose. On some of the trips I take - a knob or encoder might get broken in the pack, which already is full of important stuff like food, clothing, sleeping pad, water, pump, etc. The really important issues are the antenna and the tuner.

I don't think I've ever had so much fun with radio as I had this summer-fall at the lakes. This September, when the nights got longer, and the temperature starting going below freezing at 10,500 feet, I was in the tent, on 30 and 40M with the ATS-3B until I was too sleepy to operate, and the next day I was sitting outside in the sun, under a huge 40M loop/20M bisquare, working another QRP station across the Divide somewhere far to the East! This is so cool...

The ATS experience is one of biggest surpises I've had getting older. The ATS rigs have changed the game, because the tiny size and weight make it practical to take an HF radio so far away from the trailhead, and so high.

Steve designed the ATS radios for his trips - he knows.

Thanks Steve!

Okay Steve, that's understandable.

I was tuning up and down 20, 30 and 40 meters tonight using my ATS4 up/down switches. I really don't object to the switches other than the tuning is slow when your trying to scan the band for stations. Indeed the slow tuning rate makes for easier tuning when approaching a target station, but sometimes it would be nice to be able to move around faster and not have to resort to the DFE function.

Here's my alternate idea - How about a 1x/10x tune rate push button right next to the up/down switches? One could cruise the band in 10x mode when scanning the band and then hit the push button dropping the rate down to 1x as a station of interest is tuned across. If the operator wanted to tune elsewhere on the band, they would simply hit the 1x/10x button again and knock the tune rate back to turbo.

Maybe 1x/5x would be better.

Haven't some folks modified the firmware on some of the ATS rigs? That sounds like something that could be done with the software for existing ATS rigs. For instance, I never use the CW memories...perhaps that functionality could be replaced with some code allowing a faster tuning rate - maybe even have it so after the Up/Down buttons are pressed and held for a second or two the tuning rate increases. I think it would be nice to have the option, but I'm not really bothered too much by the current tuning rate, except when band activity is really low....and DFE takes care of the big jumps. Just food for thought/disccussing.

9986. 80-160 Dual band tranceiver with DDS AT90S2313 uP

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-03 13:03:45 UTC
From: jor
Topic: 9986 Message: 9986

Hi Steve,
Interesting project the dual band 80/160 QRP transceiver.
In the past I test the DDS design trom PA0KLT with the AT90S2313 microproseccor and thad worked fine. Also OM PAo2OHH used this principle in his design.
http://www.qsl.net/pa2ohh/04dds1.htm

I found a litle problem when multiplier the ref frequentie from the DDS with a 4060 PLL.
There is a jitter on the referentie and will be multiplied also.
It can be heard on the 14MHz VCO output when listing on a receiver.

I am interested to hear your jitter results with a PLL and VCO.
May be the jitter can be ignored with a mixing VFO

Anyhow I like the simple uP DDS design from PAoKLT.

Jor,

I'm clocking the processor at 20 MHz and have a 9 instruction accumlator loop, which is equivalent to a 2.222,222 MHz clock frequency. I use the full 8 bit sine table and D/A. Operating at 200 kHz, it produces a nice, clean sine wave after minimal low pass filtering. By using an output of 1/10th the clock very few of the sine steps are skipped when reproducing the wave form.

Another difference is I'm not using the processor to do anything but the signal generation. Therefore, I can run the accumulator as fast as it can go, without any interuptions except when the frequency is to be changed. By using a fast serial port for communications, I can send the 3 bytes needed for frequency change very quickly and minimize the time the processor isn't producing a signal output.

The weak link in my design is the R/C VCO in the 74HC4046 chip. A L/C VCO would likely have less phase noise and jitter, but after being divided by 8 or 16, the R/C VCO sounds clean and is definately suitable for CW work. I should try using it to tune in some PSK stations and see if there is any problem decoding.

Although the R/C VCO isn't ideal, it does have the advantage of an inherent wide tuning range and is more or less idiot proof, in that it doesn't have to be pre-adjusted to be in proper frequency range, which can sometimes be hard to do with a L/C VCO if you don't have a frequency counter.

Hi Steve,

The MSP430G series are available in DIP form factor and are really similar to the ATTiny Series. These are the ones usable with the LaunchPad. The more powerful as far as I know is the MSP430G2553 with 16kB flash and (only) 512B SRAM.
The MSP430G2553 can use a 32KHz xtal clock and so been used as a RTC.
I have developed a code for a WSPR autonomous beacon with it :
http://xv4y.radioclub.asia/2012/10/18/balise-wspr-autonome-avec-msp430-le-code-source/

However that's true Atmel's offer in DIP package is broader with the ATMega328 featuring more I/O, 32k flash, 2k SRAM and 1k EEPROM...

73,
Yan.

Steve,

I understand your explenation, It will be a usefull VFO for CW and give a beter sinus when the output is devided.(Lower noise to)
I am interested in the results.

In Photos PE1KTH map the schematic off the PAoKLT design 2 pages off my artikel in the Dutch QRP Newsletter in 2005.
On the right PCB the PLL with the HCT9046A
On the scoop de sinus and the spectrum.

About the 74HC4046 PLL there is a inproved one 74HCT9046A avaleble by MOUSER in DIL and SSOP. euro 2.13. one off.

http://nl.mouser.com/ProductDetail/NXP-Semiconductors/74HCT9046AN112/?qs=sGAEpiMZZMuVnCuI0aQamNA0WbGoTWKBqyRfruzi8j8%3d

In discusion with TON PAoKLT some time ago I ask him for other processors and he told me thad the Atmel controller is the best for generating because of internal functions/register.

9996. Re: Latest project - dual band (80/160) rig

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-03 12:43:08 UTC
From: Colin
Topic: 9969 Message: 9996

Steve, the new dual band project sounds like a rig that I need! I hope to get going with 160m for SOTA, my antenna is currently in the process of being built, it's a permeability tuned loaded dipole.

Where would I need to look for information of the 80/160 rig availibilty? Will you announce it on this list or at some other place -your web page perhaps?

Also, as I have commented to you before, I regard the MTR as the best rig I own. I operate almost exclusively portable from SOTA summits, so the MTR is the ideal rig for me. I would jump at the chance to own another, this time with a different band combination to include 30m. I would also like a custom case to go with the new rig, although I'd never re-house my original MTR - I think it's Altoids tin case is an important part of it's history.

I'd feel kind of guilty owning 2 MTR's though, I think the guys who missed out on the first run of kits would be more entitled to get hands on the new run.

I took my MTR on to 'High Street' G/LD-011 a few weeks ago - I had never fancied taking a HF rig with me on that summit before, weight and bulk of my FT817 putting me off. With the MTR, it was so easy to slip it in my pack. I had 57 QSO's from the summit, the most ever for me during a SOTA activation! Would I sell my MTR? Erm, let me think for a minute.....NO!

Great design Steve, the praise is well deserved.

If any UK guys fancy one of the new run of MTRs but are not sure about soldering SMDs, I'd be pleased to build it. My job entails soldering SMD's on a daily basis. I'd be able to put together the PCB to a very high standard.

73,
Colin, M0CGH

9997. ATS-3B repaired!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-03 21:08:26 UTC
From: Keith Hamilton
Topic: 9997 Message: 9997

Well I sucessfully repaired my AST-3B today! (I'm kind of proud as you can see!) It was not amplifying the side tone. I could hear stations and VERY faintly hear the sidetone in my earphones. I gently played around with the board until I found a spot that fixed the audio when I pressed on the board. I then took my thin heat regulated soldering iron to the connections. This was in the area of U6. FIXED! Must have been a loose connection. Now on to the next part of the ATS-3B project!

I recently noticed that my ATS-4B does not remember the last used frequency. When it was assembled, if I remember right, the last frequency was stored when turing off and it starts the same frequency when turning on. Otherwise, the ATS-4B is working perfectly. I am wondering if anyone expereiences the same. de JA7QIL/Katsu

10005. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-10 16:24:47 UTC
From: NAQCC
Topic: 2848 Message: 10005

NAQCC Sprint Wednesday night!

Our November sprint is this coming Wednesday evening local time (November 14, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Thursday November 15, 0130-0330Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201211.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category. Starting in November we are adding an extra category called SPECIAL for those folks. If that description fits you, you will be able to select that division and compete against others in the same situation. That will be taken care of via our autologger. As with the other categories and divisions, we'll also award a 2nd and 3rd place certificate according to the same criteria.

Prizes: Too many to list!! - We're making a change in our prize drawing for the sprints. Here's a quote from the prizes page, under the main section, on the web site: "Beginning with the November 2012 sprint, a winner will be notified as soon as one is chosen. Then the first to reply gets the first choice of a prize. Before that we went by order of sprints. In other words, the June winner had to wait for the May winner to make his choice, etc. Now it's first response, first choice no matter what month. That way those who take forever to answer won't hold up those who are eager to get their prize. If someone doesn't reply at all by the end of the following month, there will be a re-drawing to choose a replacement winner for that sprint, and the one who didn't reply becomes ineligible for any future drawings. For example, the June winner has until the end of July to respond."

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6290+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Come join us and have a real good time!

Thanks, Steve:

Best laid plans of mice and men - even genius fellers like you, sometimes run into "bumps in the road." GL in your endeavors. A bunch of us wait with baited breath!

I hope I'm quick enough to get one of your 50 or so projected 160/80 meter kits. Sometimes I get called away from home for a day or two, and can miss out if you have a quick sell out.

One question, if you have time - will the Direct conversion rig run @ 9 volts? I LOVE the ability to run with 9 volts on my AT-Sprint. Runs nice and cool.

10009. Fox: Hunt Tonight - WC7S

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-13 14:48:07 UTC
From: Dale Putnam
Topic: 10009 Message: 10009

I will be one of the FOXii tonight, with the exemplary K4BAI, in the 40 acre forest.Somewhere between the two trailheads marked 7.050 and 7.030, we will be out of ourdens by 0200z and will return to the safety of our den again by 0330z. Ok.. that's the layout, here's the straight info,The exchange: RST, SPC, Name, Power (not more than 5 watts!) Listen closely to what is sent by the Foxii, the call will be:"FOX WC7S UP... (or) DOWN" For those close, try to grab a pelt early, if not successful, don't give up, I have 5 antennas that all work well, and I will be changing antennas often to allow all hounds a chance to grab a pelt.Stay late too, the props often slip in a late hunt opening starting about the time the band goes long, to select areas. The equipment here will be a K2 at 5 watts, (my tribander is offline currently). The antennas:Three 360 foot long center fed at 50 ft, fed with balanced line. A 100 foot dblt at 30 ft, fed with open balanced line,and a vertical on steel roof, 15 ft above ground. I'll be sly, shy, and listening intently for you. See you tonight!!

--... ...--
Dale - WC7S in Wy

I will be the other Fox in tonight's QRP fox hunt on 40M (with Dale,

WC7S, in WY). Look for the two foxes between 0200 and 0330Z Tuesday

night (9 to 10:30 PM EST) between 7030 and 7050 kHz. Run no more than 5

watts. I will be using an FT1000MP at 5W output as measured by the WM-2

QRP Watt Meter and a coax fed 40 meter dipole up about 40 feet. I will

start out listening UP and will indicate that by CQ FOX DE K4BAI UP.

When the pile up dies down, I will stop saying "UP" and will be

listening on my own frequency. The exchange is RST, SPC, Name, Power.

So, I will be sending real RST, GA, JOHN, 5W. Hope the skip won't be

too long and that I can work most of the country. It will be difficult,

but not necessarily impossible, for those close in. Give it a try and I

will keep it up for the entire 90 minute period. 73/72, John, K4BAI.

10010. Pixie II Questions

Yahoo group: AT_Sprint (2012 — 2013)

From: Chris Maness
Topic: 10010 Message: 10010

I am looking to build a Pixie II to take on a trip. Is there a small external audio DSP that can narrow the passband of this little guy? Seemed like a neat little rig, but I am not sure I can deal with hearing 50 different signals at once in that giant passband. It sounded like it was at least 10k wide.

I am new to DIY QRP. I have a FT817, but it is not as travel friendly as I would like it to be.

Not a DSP, but the switched-capacitor audio filter from NEQRP is a popular addition to simple rigs like this. See the NEScaf at http://newenglandqrp.org/store

The RockMite is a good performer for the money.

I manage ok without extra filtering, but I can see why some folks like to add an audio filter as you sometimes seem to be able to hear the entire band at once!

You might also check out the Czech kit at http://www.hamshop.cz/stavebnice-c4/audio-cw-filtr-i160/

Nowadays my MTR goes out more often than the Rocky :-)

Thanks, Bill. I wonder if anyone has the board artwork with a Pixie II available. I would like to buy both kits and put them on one board. Very cool.

The problem is the Pixie II really doesn't work very well, in fact it is a complete waste of time and natrual resources. You'd be much better off getting a Rockmite or my DCxx rig from qrpkits.com At least with either one of those rigs, you actually have a chance of making a contact or two.

10019. FOX FOXHUNT Thurs pm

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-15 01:18:48 UTC
From: Dale Putnam
Topic: 10019 Message: 10019

There's a FOXHUNT Thursday evening (7pm MT) or Friday morning 0200z (whichever way you set your clock from DST.. or not).Bring your best horse and dog.. and of course ... your best fist... oh.. and don't worry about the BIG ENGINE.. you will only need 5 watt brake horsepower, measured at the axle tx. Gather up at the edge of the 80 acre wood and mount up, ready to ride at 0200z or 7pm MT and we will go hunting... a hunting we will go...somewhere between the two markers marked 3.550 and 3.570. Dave N1IX and I, Dale, WC7S will be your shy, sly, slick, FOXii. Here's the deal, you listen real good, y'hr? and we will tell you where to plunk down to fire.... sometimes, historically, the FOXii will look UPhill.. and other times.. Dwnhill. so be listenin' and of course, since it isn't real comfy to pileup on top if each other.. you can't reach yoursippin liquid.... nor find you glasses to look for us with... besides that.. elbows and knees don't make soft sittin.... so SPREAD OUT ... you just might find it a whole lot more productive. After you make your shot, one time.. maybe twice... hush up and listen some more.. we will be moving around.. and it would be advisable to be prepared to fire again, from the right place... another reason to not get all stuck up together... no movin room. When you hear your shot hithome... answer with the signal report, (RST) , your state, province, country, (SPC), your name, and Pwr, (no more than 5 w or you will be de-listed, and no one wants that) So.. Let the Games Begin, and May the Props be ever in OUR Favor

Dale Putnam wrote:

There's a FOXHUNT Thursday evening (7pm MT) or Friday morning 0200z (whichever way you set your clock from DST.. or not).
Bring your best horse and dog.. and of course ... your best fist... oh.. and don't worry about the BIG ENGINE.. you will only need
5 watt brake horsepower, measured at the axle tx.

Gather up at the edge of the 80 acre wood and mount up, ready to ride at 0200z or 7pm MT and we will go hunting... a hunting we will go...
somewhere between the two markers marked 3.550 and 3.570. Dave N1IX and I, Dale, WC7S will be your shy, sly, slick, FOXii.

Here's the deal, you listen real good, y'hr? and we will tell you where to plunk down to fire.... sometimes, historically, the FOXii will look
UPhill.. and other times.. Dwnhill. so be listenin' and of course, since it isn't real comfy to pileup on top if each other.. you can't reach your
sippin liquid.... nor find you glasses to look for us with... besides that.. elbows and knees don't make soft sittin.... so SPREAD OUT ... you
just might find it a whole lot more productive.

After you make your shot, one time.. maybe twice... hush up and listen some more.. we will be moving around.. and it would be advisable to
be prepared to fire again, from the right place... another reason to not get all stuck up together... no movin room. When you hear your shot hit
home... answer with the signal report, (RST) , your state, province, country, (SPC), your name, and Pwr, (no more than 5 w or you will be de-listed,
and no one wants that)

So.. Let the Games Begin, and

May the Props be ever in OUR Favor

10024. ats-3b with a receiving loop

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-19 15:26:31 UTC
From: Vojtech
Topic: 10024 Message: 10024

Hi gang.

I am trying to develop a receiving loop for myself to be used for listening when on business trips. I was thinking of connecting the receiving loop more or less directly to the mixer of the ATS-3b, the great thing of the ATS-3b, the mixer input is directly accessible at the band module connector. All the selectivity would be provided by the Q of the magnetic loop. If the small mag loop does not provide enough signal, the SA612 mixer has enough of gain to overcome it, if the input network is replaced.

Could someone please share following article with me? It is supposed to describe a similar setup.

Shielded Loop Receiver by N1BYT (Cover story on QST, October, 1997)

Thanks and 73, Vojtech OK1IAK

10026. ATS-series rigs & autotuners?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-19 16:12:31 UTC
From: ae5xae5x
Topic: 10026 Message: 10026

I know ATS3 and ATS4 rigs do not have SWR protection and that their use with an autotuner is not recommended. Would it be safe to use an autotuner while powering the rig with a 9V battery or is even this risky?

Possible better protection would be to us a 6v supply... or the 9v supply with a 5 ohm resistor in series with it. It should be ok at 9v, but that would depend on exactly how much current is drawn during the autotune process, it is theinstant changes that cause problems.

Yes, some of the wild load swings can cause problems, even if they are
brief.

My plan (which I've been meaning to get around to for a couple months) is
to build a standalone Tayloe SWR bridge to put in line between the rig and
auto-tuner. That way, the rig would never see a bad load that causes the
current to go too high and melt the finals....and I wouldn't have to mess
with the voltage to the rig.

The key will be to 1) remember to put it in line before tuning and 2) take
it out of line after!

You may wish to take a look at the Hendricks QRP "BLT+" tuner. It has a 50 ohm load that is in line when making adjustments, that way the rig sees a proper load.

Hi John, Using either tuner would likely be ok, with 9v in, but the ZM-2 does not have sudden switching transiets that MIGHT cause a problem for the FETs in the finals. AND it has a tayloe bridge to provide a load to the tx. The T-1 has been engineered to minimize the switching transiets, and I have used one with a 3b a number of times, without an issue. I was using 9v tho. I very seldom press for the utmost out of the tx... My 3b has a 5ohm resistor that I switch in series with the power lead, to tune with. Lets the tx see about 9v.

Those are the same tuners I have for QRP and much prefer the T1 if I'm going to be switching bands often. I guess I'll use the 9v batt + 5-ohm suggestion.

Tnx all,

Dale-

I have used the T-1 with my ATS3 for several years with no problems. I always use a 9v battery while tuning. I usually then manually switch to 8 AA pack but, often leave the 9v battery connected (especially if it is a new one). One of these days, I will incorporate a switchable "tune" switch on my battery pack.

10038. Re: [AT_Sprint] ATS-series rigs & autotuners?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-19 18:19:59 UTC
From: Hank Greeb
Topic: 10026 Message: 10038

I've had no problems at all with a 9 VDC (nominal) power source (8 AA NiMH cells, rated at 9.6 V 1600 mAH) with my LDG Z-100 tuner. I use it with my original version of the AT-Sprint (no suffix) It has put out 3 watts into SWR=3.0 with no problem whatsoever. With the LDG tuner the SWR is less than 2.0, and, if I use a SWR bridge in series with the tuner, it often is between SWR 1.2 and 1.5.

The manual which came with my rig says that one must be careful of SWR when running 12 VDC because the peak voltage on the finals can be very near the breakdown voltage, if SWR >2 or so.

The ATS-3b has overload protection built in, so if the finals draw more than a present amount of current the system shuts down. There's still a warning about high SWR I'm not familiar with the ATS-4 series.

Hi John,

Using either tuner would likely be ok, with 9v in, but the ZM-2 does not have sudden switching transiets that MIGHT cause a problem for the FETs in
the finals. AND it has a tayloe bridge to provide a load to the tx. The T-1 has been engineered to minimize the switching transiets, and I have used one

with a 3b a number of times, without an issue. I was using 9v tho. I very seldom press for the utmost out of the tx...
My 3b has a 5ohm resistor that I switch in series with the power lead, to tune with. Lets the tx see about 9v.

You may wish to take a look at the Hendricks QRP "BLT+" tuner. It has a 50 ohm load that is in line when making adjustments, that way the rig sees a proper load.

I use a Duracell Alkaline 9v as they are easy to find anywhere I travel to. As Dale says, they do not last long but I have used a new one for 30 minute sprints and other short runs without any problem. One time, I forgot my 8AA pack and used a twin pack of 9v alkalines for an ARS Sprint (where weight is a factor). Used the first one for the first hour and then switched to the second one for the second hour. Worked great. I primarily use it for tuning up though.

I was never satisfied with the voltage drop I was getting with an alkaline 9v when transmitting - but the primary lithium has been great - I've gotten two full ARS sprints plus still have juice left out of a single battery - which is lighter than a standard 9v. Unfortunately, they're not cheap...but I don't use that rig a lot, so it's not as bad as looking at the price tag might imply.

I do use a standard 9v when I'm just listening, which is mostly what I seem to do with my ATS3b.

I've been using a 2S LiPo with great success with my MTR. Power out seems to be about 2.5w at 8V, more than the specs from KD1JV would suggest.

I have also used 8off NiMHs, they work well too, if more power is needed.

http://m0cgh.blogspot.co.uk/2012/11/buckden-pike-remembrance-sunday.html

I have an ALT tuner on my bench at the moment, I'm just fitting it in to an Altoids tin, I hope to use this with the MTR.

John :

I have a T1 and I either hook up the ATS-3 to a 9v battery to tune, or if I remember I bring along my Tayloe SWR bridge and hook it up between the rig the T1, that way the ATS-rig always sees 50 ohms during tuning.

On a related note, I have made several QSOs in the field with the Taylor SWR bridge in the TUNE position ;-)

Just to clarify - I'm only thinking of using a 9v battery for the auto tuning cycle in order to limit power out and current into the rig at that time.

Once tuned, I'd then switch to my normal battery pack which would be a 3S LiPo or 10/12 NiMh AA cells, preferably Eneloops:

Safest thing to do is have a resistive bridge SWR indicator switchable inline, ala Dan Tayloe style. For any type tuner. Switch it in for tuning, switch it out when done. With this type of system, the transmitter never see greater than a 2:1 SWR, whether the antenna and tuner system represents a dead short, completely open circuit, or anything in between. Done.

Not quite. 8-) With an open circuit load, the transmitter "sees" 100 Ohms as the load. With a short circuit, the transmitter "sees" about 25 Ohms.

I have also made many QSOs with the bridge in-line when I forgot to switch it out. It's a price for protection.

The ATS-3 and 4 rigs have an overvoltage protection of the form of a Zener diode parallel to the source - drain of the power FETs. This eats up the high voltage spikes induced when no load or a highly inductive load is connected.

The output FETs may either die of overvoltage, or from heating through excessive power losses, mainly from low output impedance. As long as they are not operating into a short circuit directly, it will take a time to overheat to the extent to burn.

I have used the elecraft T1 autotuner with LiIon batteries without problem. During my development of the ATS-3b alternate firmware and the digital firmware, I have transmitted without an antenna a lot, which develops high voltage spikes at the FETs, which are clamped by the Zener diode. This never killed the FETs.

I only killed the FETs twice, once when I transmitted 3W out of a LiOn battery into a small magnetic loop, which was not matched correctly. Second, when I received a prototype from Steve, which did not have the clamping Zener diode at all, and with which I transmitted without load, as I was used to with an older ATS-3a.

If you are worried about your finals, you may try to send dots with you T1 autotuner. The autotuner is specified to work even with SSB and the dots let the finals cool down in case of low impedance high current spikes into the finals.

Actually, what seems to kill the FETs more than anything is over current. The versions which used the 2N7000 finals (pre 3B's) were the most prone to this. When I made the switch to the BS170's which have a higher current rating, over current became much less of an issue and have proven to be reliable. However, it still is a good idea to be careful with them...

Hello Steve
I take this opportunity to ask a question
I have BS170 stock because you never know what can happen ...
is it possible to place 3 BS170 without changing the polarization
in ATS3A?

I take this opportunity to say that we must be wary of ATU, I had a problem with the T1 TX HB1b as he sought the proper impedance on a long wire antenna,
the RF voltage and climbed back to the exceeded the standard voltage on the diode Zenner ... it is passed courcircuit the choke to burnt toast and HF electronic switching, TX / TX, and a few other things ... (Fun for more! ...)
I think we should be careful enough, the setting time is sometimes too long, the ideas of some of you do not put 12 volts for trimming and placing a load
passing 50 ohm and a transfer switch is a good idea ...

Actually, what seems to kill the FETs more than anything is over current.
The versions which used the 2N7000 finals (pre 3B's) were the most prone to
this. When I made the switch to the BS170's which have a higher current
rating, over current became much less of an issue and have proven to be
reliable. However, it still is a good idea to be careful with them...

No, check the datasheets. The pinouts are reversed. You would mount them backwards if replacing 7000's as the source and drain are opposite.

The pin out is reveresed. With flat side towards you, 2N7000 goes DGS while the BS170 goes SGD. So, if replacing 2N7000 with BS170, the BS170 must be installed "backwards" to the outline of the 2N7000.

Hmmm.

Jumping in in the middle of this discussion:

I own an ATS-3A and an Elecraft T1 tuner. I have never had any issue with broken finals. However, I guess I could reduce the risk by replacing the 2N7000s with BS170s. Is there anything else I could do to reduce the risk of killing the finals? If I remember correctly, you have talked about overcurrent protection in later ATS models. Current limiting? A simple resistor?

Placing a 5 ohm resistor in series with the power input, then shorting it out for full power.. and utilizing it in circuit for tuneup, will limit the current and provide very nice protection for the spikes incurred with a T1.

Date: 2012-11-24 03:14:11 UTC
From: radio_kx0r
Topic: 10026 Message: 10065

I replaced the 2N7000's in my ATS-3B with BS-170's when one of the 2N7000's shorted out in 2011. The BS-170's have been on numerous field trips and backpacks, always running on 3S Lithium Ion cells at 5W out and 12.3V. So far, lots of fun hours on these littel devices!

There was no significant difference in tuning, power output, or current consumption, even on 15M, after I did the swap.

Because the BS-170's have reversed pinout, the flat sides of the TO-92 cases will not be flat against the board like the 2N7000's were. I was bothered by this, so a created a small copper heatsink that's lightly clamped across the flat faces of the BS-170's. Thermal grease helps the heat flow to the copper.

If you go to the Photos section of this site, look in my KX0R folder, and find - hidden away on page 2 - close up photos showing the BS-170's with the copper heat sink.

It's true that the heat sink adds a few grams of mass, but it provides some peace of mind when calling CQ on 15M with 12V going in and 5W going out. It's cheap and easy. The copper didn't mess up the tuning either, even though it's connected to the PCB ground.

Also it's a good idea of using a series resistor to protect the rig while tuning. Mine is about 6.7 ohms. It knocks the output down from 5W to 2.5W with 12V in. The amazing thing is that the entire radio still works perfectly with the series resistor, even though the supply voltage is bouncing around. The keying is fine, the receiver is unchanged, and all's well. The current drain on transmit is reduced, so it's an easy way to extend the battery if you need to. This ability to run with series resistance doesn't hold for the ATS-3A, but the 3B can handle it.

It's smart to tune with a Tayloe bridge to limit the stress on the final stage. The combination of series resistor on the supply and Tayloe bridge on the tuner are all you need for safe tune-ups.

Some are scared to run these tiny rigs near full power, so they run on 9 or 10V, and the listener hears more QSB. Be brave - adjust your toroids and capacitors - run 4 or 5W - just tune up carefully and get a good match before you let the rig do its best.

Note that if you really want less power out, you can leave your Tayloe bridge in the tune position, and them you'll have about 6 db less (1/4 power) compared to what you had straight through - assuming a 50 ohm match.

Has anyone tried maxing out a set of BS-170's? How high will they go before they fail? Has anyone tried a single (larger) mosfet in these rigs? Who will be the first to get 10W out of an ATS rig? I'm serious...just not with MY rig...

I would *love* to see built-in protection for the output stage of my ATS4. Steve, that would be #1 on my wish list! Please?

I've already burned up two sets of B170s -- one with an inadvertent high SWR using an AlexLoop (when on a SOTA a stranger stuck his head near the loop to read the label and in the process totally de-tuned the loop), the second by running my LiPo battery at 12.4V with the replaced B170s, which I was unable to bring exactly to the case as a heat sink. Well, they're apparently not totally burned out, I still get almost 2W output with 11.4V in.

I'll have to look at KX0R's heat sink solution as a possible remedy. Meanwhile, I charge my LiPo, then bring it down to "storage" level at 11.4V and take it into the field at that level. I find that I can run between 4 to 6 SOTA activations between recharges. Between times the battery sits in a fireproof "battery safe" bag in our refrigerator.

Lee,

I have several new Li-Po batteries. I have some 350mah, 500mah, 800mah and 1200mah units. It is my hope that the 350mah unit will operate for a whole two hours as in the Spartan Sprint. The 1200 should last for several hours on a summit. But I don't know for sure yet.

If I could only get my ATS-4B back from where I sent it, I would get a chance to try these batteries. If (or when) I do, I will report to you how they work. The 350 is small and light. And cheap too.

I do have a 3600mah Li-Po battery inside my FT-817, and I have run up to 4 hours on that without a problem. I don't usually spend more than 4 hours on a summit anyway.

Mike - KD9KC.

^^^ Thats not something one would expect to happen! Heat sinking has little or nothing to do with it. If the FETs are running more than slightly warm to the touch, even at 5W out, then something isn't right.

As I've noted before, over current is the PA killer. The simplest protection would be a 1A fast blow in-line fuse (and a fist full of spares). This is a good idea to add when using any high current capacity supply, battery or bench.

I suppose it could be possible to make a fast current limiter. One which would reduce the voltage to keep the current from exceeding a safe level would be ideal, rather then the over current rest I did on the 3B's which most people found more annoying then useful. I'll have to think about that.

Hi Steve,

Is there any good reson not to use a stronger FET in the AT-sprint PA
like the Farchild IRLR/U110A with a Ciss of 180pF ?
Or the Farchild RF power FET PD85004, 4 watt output (DigiKey euro 2.92) Cost a litle more
bud are stronger for high SWR ?.

Mike:

I have a bank of 8 AA size NiMH cells, 1600 MAH, 9.6 volts nominal.
They ran my AT-Sprint (original version) for 10 hours @ 3 watts out
during the August 2012 NaQP contest. Made 175 Q's. I'd say your 1200
MAH LiPO's should be great for SOTA work. I think the bellandwhistles
of the 4b might take a bit more power than my rig, but not that much more.

Typically, the gate voltage thrushold of power mosfets is too high and can't be driven directly with 5V square waves efficiently or at all, nor do they switch as fast. At least I haven't found a power fet yet which works nearly as well as the BS170s. It's really a non issue. Yes they can fail, but it's not all that common.

From: Saad Mahaini
Topic: 10075 Message: 10076

Hello folks,

I'm making progress on building my ATS-4A kit. However, i hit a little bump. The kit has two many 104 resistors and no 103 resistors at all. I need seven 103 resistors.

What is the part that i need to order from mouser or digikey for these? I never ordered SMT parts before so not sure what size, etc to specify

Thanks again

10079. DX contests make for lots of fun!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-28 18:15:08 UTC
From: charles
Topic: 10079 Message: 10079

I used my ats-3b.1 this past weekend during the dx contest and had lots of fun! Most of my contacts were made on 15 meters at about 1.7 watts to a base loaded whip which extends from my east-facing, third floor apartment window. I worked Brazil several times (4000 miles!) and the Pacific coast of Canada (2300 miles) several times too. Just couldn't break through the pile up for the Alaskan station which I heard really well for about an hour ... nevertheless, it was a great time (I spent about 10 hours operating between the two days which was plenty for qrp) ... I made a few contacts on 20 meters (running about 3.8 watts into the same antenna configuration) but it was much too crowded for me down there. Up on fifteen there were fewer stations, but loud and eager ... Russia, and all over western europe for a total of about thirty contacts! My style of operating (while watching lots of college and pro-football) would be to wear my wireless headphones and wait until I heard the DX station exhaust the pile-up and repeatedly call CQ ... then I would pounce and almost always get the station to come back. I didn't have to do too many fills either, thanks to the BIG ears on the other end. Looking on QRZ.com at some of the stations I worked and their massive antennas and towers, it is understandable that they would create pile-ups, and be able to hear my little signal!. The pleasure was immense! 73 de chas ai4ot

10080. Wed Nite Nets

The Four State QRP Group's Comfortable nets meet each Wednesday night beginning at 7:00 PM CST, 0100z. Add anything to the exchange that you wish, temp rig, ant, etc. Wayne will be missing from the 40M nets tonight. Jump in and have fun anyway. The PSK net at 9P is picking up in activity. So if you like PSK, give Dick, N0TGR a shout tonight.

7:00 CST 0100z ... 80M CW Net on 3564, WA?ITP NCS.
7:30 CST 0130z ... 40M CW Net on 7122, KC?PMH NCS
8:00 CST 0200z ... 80M CW Net on 3564, WA?ITP NCS.
8:30 CST 0230z ... 40M CW Net on 7122, KC?PMH NCS
9:00 CST 0300z ... 80M PSK Net on 3580.5, N?TGR NCS

All are welcome.

I love this radio stuff !

From: Yannick DEVOS (XV4Y)
Topic: 10083 Message: 10083

Dear Steve and fellow ATS/MTR owners or soon to be owners,

With the dry season I will see more and more power outage like I had today.
This morning, no electricity from 7:00 to 17:00 this afternoon. I have the generator running several time during the day for the refrigerator but keeping it running just for playing radio is a bit expensive.

Well, what I wanted to say is that in the coming months I will use my MTR running on batteries more even at home.
I have no comments about the general specifications of the rig and as I am aware of what it was design for I am really happy with it.
Ergonomic, performance, and price are outstanding for kit that you can proudly show to the less lucky ones using only commercial equipment.

I have only one suggestion about the ergonomic and I think that can be easily implemented in the firmware.
I should even do it myself but I am so bad at assembler that I could do more bad than good fiddling in the code (even if I learnt MC6803 ASM when I was 11).
When tuning the band looking for a signal, I would like to have the 8-seg LED display to flash a 0 and 5 when crossing every 10 KHz or 5KHz.
Without, I often find myself obliged to stop tuning just to hit "MENU" and check if I am not too high or too low in the portion of band I want to scan.

Yan.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-11-30 08:53:53 UTC
From: Yannick (XV4Y)
Topic: 10083 Message: 10087

Hi Randy,

Well, about the audio indication, the problem is that the "dit" is already used by the band limits indication.
Using a "double dit" for tens of KHz could be misleading and modifying the actual behavior of the firmware for the band limits could be disturbing for current users.

About the band limits, I found a strange behavior, I don't if it is a bug.
I am using the corrected firmware dated 25 May 2012 by VK2DDJ.

I am mostly using 20m so I did not notice this before and it is not really annoying to me.
On 30m VK2DDJ set the limit to 10.125. It is too low for me as there are significant activity up in the band sometime.
When tuning, the MTR stopped at 10.120 (not 10.125). Using the UP button it is impossible to tune upward.
If use the DFE mode, I can set the frequency to 10.121 or 10.200 (did not try upper).
Then, if I use the UP button, the rig refuses to go upward, but using the DOWN button I can tune downward to 10.100...

73,
Yan.

From: Yannick
Topic: 10089 Message: 10089

Hi,

I have a couple of used surplus PA using a push-pull of 2SC2290 in class C.
http://capheda.files.wordpress.com/2010/06/100_2425.jpg

I have been using one successfully with my SoftRock RXTX, putting out 10W for a little less than 1W in.
I would like to try them with the Mountain Topper Rig.
What is the best way to have a keying signal from the MSP430 ?
Can I use the signal from P1.7 (pin 28) and somehow add a circuit similar to Q3 in parallel (using a Bs170) ?

Thanks for your help.

10090. MTR custom cases

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-05 03:14:15 UTC
From: Steven Weber
Topic: 10090 Message: 10090

Just to let every one know I got the ball rolling on getting a custom MTR case made by Ten-Tec. It will be about 8 weeks before they are ready, so looks like the end of January. I'll try to have more MTR kits ready about that time too.

The price for just a case will be $20 plus a little for postage. The top will be painted and silk screened. I decided on blue for the color. The bottom piece will be left unfinished aluminum, which should be a decent contrast to the blue, but you can paint it if you like. The box will be about the size of an Altoids tin, but a tad taller at 1.1".

There will be enough space inside the case to install a 9V radio battery if you like. However, you'll need to add an on/off switch and you'll have to make the hole for that yourself.

72, Steve KD1JV

Steve, will you be selling cases as ad on options with purchase of a basic MTR? And will the cases be available alone for previous MTR BUILDERS

I have one MTR mounted in a homemade aluminum enclosure. When available I would like to order a second MTR and two cases.

I assume that at some point you announce that you are accepting orders.

Ten Tec does fine custom work. God choice.

Hi Steve:

Let me tell you that mine use a little top edge that help protect the radio controls buttons when package and also thus can be extended on the antenna side for protection too.

Anyway, I guess you already have the box design. Mine is also blue, but in light color with the base painted in light gray too. The color combination is very good for me.

Good luck,
Milton

aka WS0TA
--

Hi Steve:

Let me tell you that mine use a little top edge that help protect the radio controls buttons when package and also thus can be extended on the antenna side for protection too.

Anyway, I guess you already have the box design. Mine is also blue, but in light color with the base painted in light gray too. The color combination is very good for me.

Good luck,
Milton

From: Hank Greeb
Topic: 10090 Message: 10095

I've been very interested in the 160/80 meter rig which Steve mentioned some time back.

Last word was "still in design phase." (or something to that effect)

Just curious, any new info?

Waiting on pinzandneedles.

Hi all
my name is Phil and I live in Santa Fe, NM. I would love to be able to do SOTA's , run up mountains etc... I am just starting to relearn CW again after many years of neglect and SSB.
Love to build my own gear solid state or hollow state (tubes) happy to do surface mount or thru hole. Look forward to building some new ATS stuff.

Topic: 10090 Message: 10098

Milton,

The case Jerry at Ten-Tec suggested after looking at my inital design, which was like my ATS-4 case, is very similer to what you did except the other way around. The top piece is folded down along the front and back instead of the sides. This allows the antenna, power and paddle jack to be mounted on the back side and the head phone jack on the front. I belive this is a more logical place to put those jacks. Edges on the bottom piece will stick up above the top of the case along the sides instead of the front and back.

The top piece will be made from 036 steel and the bottom from 062 aluminum. The two pieces are held together with a screw on either side, near the top.

Steve KD1JV

Let me tell you that mine use a little top edge that help protect the radio controls buttons when package and also thus can be extended on the antenna side for protection too.

The next batch of MTR's will come with the case. I can't see where very many wouldn't want one, so it makes no sense to make it an option (and my potentually being stuck with a bunch of cases).

I'm having an extra 100 cases made for previous MTR builders. This is about 50 short of the number of kits out there, but I figure at least that many have put the board in a case which they are happy with.

Thanks, as always, Steve.
My abortive attempt to shoehorn my MTR into an altoids tin is here:
http://www.flickr.com/photos/jonathancharles/8220840616/
I discovered--by my own stupidity--that the Altoids tin won't work without some pigtails or some very tight squeezes--nearly impossible. Then I remembered that you might have warned us of this.
One positive thing I learned was that the height of the buttons and switches felt really great in the recessed plexiglass divots I drilled and formed. I might use this idea in the future--because most of the fun of building the MTR is being able to SHOW the MTR.

From: Hank Greeb
Topic: 10090 Message: 10104

All the talk about the Mountain Top (two band) radio makes me wonder - would it be possible to modify the software for the MTR, the output filter, and maybe (probably?) a few other things which don't come to my foggy (lack of) brain, and have a 160/80 meter "pseudo MTR?" Don't know that anyone would want to operate on 160 or 80 from a mountain top, but there are other uses for these neat, itty bitty rigs.

72/73 de n8xx Hg
QRP >99.44% of the time

p.s. The versatility of these rigs, and the possibilities for operating @ 3 to 5 watts with a rig which fits in the palm of one's hand, never ceases to amaze me!

Hi Steve:

I am sure either way it helps keep secure the MTR when traveling. I want to use .062 aluminum on both parts, but didn't have any available at home. Ja

The back panel design this way, can be extended a little more to create a better protection for the antenna and other connectors on each side. But again, the material available was not enough.

The ATS4 box you create was really the starting point for my one.

Best wishes this Christmas.

The new case looks great but there is something very MTR-esque about building into a Altoids box. I have come to associate the ATS and MTR line with mint tins. I don't think I could possibly switch either of mine without psychotherapy.

I hope that if you ever rev the design it will still fit in one because I think there is nothing cooler than one of your rigs in a tiny box.

I tend to agree...I really like my ATS-3b in its "Sindy" Altoids tin (
http://www.aa4ga.com/2012/04/steve-webers-ats-3b.html), but also like the
idea of a finished box for the MTR so I wouldn't have to cut all those
little rectangular holes!

Thanks to this group, a previously-built MTR is now in my eager hands and has provided several excellent contacts.

However, it is necessary to use the RIT function to hear the other station clearly as the offset between transmit and receive appears off.

I've looked through the assembly manual online and ..., well that's why I'm seeking the collective wisdom of this group.
Without test equipment and with 68-year old shaky hands, how does one adjust the receiver offset to center the received signal in the passband permanently, so to speak, e.g., without using RIT each time?

Thank you,
Don, K3RLL

10119. Latest project - dual band (80/160) rig

Since Steve's new design is quite a departure from the quintessential ATS series designs, I propose a new name for it.

In the spirit of fun, since it's not my place to name it, how about calling it RC DC ? It describes both the oscillator and the receiver.

Whatcha think?

I love this radio stuff !

Subject: [AT_Sprint] Latest project - dual band (80/160) rig

| Okay, here's what I have been working on recently and is almost, but not quite finished. A 80/160 dual band rig with Direct conversion receiver and a DDS/PLL hybrd VFO using all through hole parts.
|
| The DDS is a low frequency (219 kHz) signal produced by software and is used to tune an R/C VCO operating at 28 MHz and then divided down to the desired frequency.
|
| The Direct conversion Rx is a high dynamic range type with no input tuning, other than the transmitter LPF.
|
| The tranmsitter is my classic BS170 design, but with a variable PA supply built in so the power output can be adjusted.
|
| Although the VCO operates at 28 MHz, operating above 40M probably wouldn't be a good idea and will not be tested.
|
| Operation below 160 M, like the 500 kHz band should be possible.
|
| The rig includes a LCD frequency read out, built in keyer and rotary tuning.
|
| For some more info on the design see
http://kd1jv.qrpradio.com/SDDCTR/SDDCTR.htm

|
| I'm thinking of doing a very limited run of 50 kits for this, I imagine these would go quickly? I might be able to have these ready for sale by the end of the month. As for price, I haven't figured that out yet, but I would guess no more then $75.00

No, you should not have to use RIT all the time. You probably don't have the BFO trimmer set quite right.

10122. ATS4 volume mod

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-07 19:58:26 UTC
From: cloud runner
Topic: 10122 Message: 10122

One can change a fixed resistor in the ATS4 for more volume. I experienced the result of this mod yesterday with a friend's ATS4-A. Plenty of room on the volume control.

I have an ATS4-B. My volume is a bit low, and the volume control (which works fine) is always set to maximum. Is the change equally valid for the B version, and if so, what is the change???

Thanks,

73 Fred - kt5x

The 4B has an AGC circuit which limits the max volume. This can be increased by removing R46. Unless your talking about side tone volume, in which case the 4B has an independent level pot for that, which is hidden under the volume control knob.

Steve

10126. NAQCC Sprint Tuesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-08 03:49:05 UTC
From: NAQCC
Topic: 2905 Message: 10126

NAQCC Sprint Tuesday night!

Our December sprint is this coming Tuesday evening local time (December 11, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Wednesday December 12, 0130-0330Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201212.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - We're making a change in our prize drawing for the sprints. Here's a quote from the prizes page, under the main section, on the web site: "Beginning with the November 2012 sprint, a winner will be notified as soon as one is chosen. Then the first to reply gets the first choice of a prize. Before that we went by order of sprints. In other words, the June winner had to wait for the May winner to make his choice, etc. Now it's first response, first choice no matter what month. That way those who take forever to answer won't hold up those who are eager to get their prize. If someone doesn't reply at all by the end of the following month, there will be a re-drawing to choose a replacement winner for that sprint, and the one who didn't reply becomes ineligible for any future drawings. For example, the June winner has until the end of July to respond."

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6340+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Come join us and have a real good time!

From: radio_kx0r
Topic: 10118 Message: 10127

Don,

Steve is right about the BFO adjustment.

What you really should do is to go to the part of the manual on P13 (for the 4-20-2012 manual version) - available in KD1JV's FILES here on this website. This is Local Oscillator frequency trim and BFO adjustment. If I were you I would go through the whole thing. Steve's procedure is concise and will give you a precise alignment, provided you do just what it says.

Consider borrowing a scope or taking the rig to someone who has a scope, and follow the procedure. The numbered steps are all important for setting up the BFO so the desired signal is centered in the crystal filter passband, accurately lined up with the transmit signal, and so the beat tone you hear is centered in the selective audio filter.

When you tune across the filter passband, counting the steps like Steve says, be sure you go all the way across to each side while watching the signal amplitude, so you find where the crystal filter falls off rapidly at both edges of the passband. There may be small variations within the passband, but what you want to find is the the full width of the filter's passband, and then set the signal in the center of that, by counting the total steps divided by 2 like Steve says - not at the actual peak of the filter!

Since the BFO is a bit off, you would be smart to check the other adjustments on pages 12 and 13. The reference oscillator calibration may not be required, and doing it requires some equipment like a counter and/or test oscillator - usually the reference oscillators on these rigs are pretty close to start with - but if someone tried to do the cal and did it wrong, the cal could be off enough to matter.

If you want to cheat, just adjust the BFO trimmer so the receive signal lines up with the transmit signal with the RIT off. You can do this using another rig, provided its receive and transmit frequencies are lined up accurately also. Be sure to transmit both rigs into dummy load(s), not into each other! Carefully avoid excess signal into either rig's receiver!! This way you can avoid using the RIT on most signals.

However, just because the receive and transmit signals agree in your MTR doesn't tell if the rest of the alignment is right.

The receiver input filter peaking on page 13 is worth checking, because the peak on one of the trimmers for each band is really sharp and must be set carefully. Maybe the builder didn't get it quite right also. Ideally you should do this using a signal generator, but you can peak it with an antenna or other signal input. You need to make certain that whatever you connect to the MTR antenna jack is close to 50 ohms resistive before you adjust the trimmers. If you peak the trimmers with an antenna that is not exactly 50 ohms, the trimmers will be off. The easiest way to be sure is to use an RF attenuator on the antenna input - at least 10 db - that way the input of the MTR will see about 50 ohms for the adjustment. If you have enough noise coming in, you can peak on the noise if you can hear the peak. If you peak on a signal, use a signal that isn't varying in strength. Do

this adjustment for each band near the frequency you plan to use.

This is a very nice receiver once you have it adjusted!

Regarding the BFO alignment and a scope

If you don't have access to a scope, I've made these kinds of adjustments monitoring the audio output of the rig using digital modes software. So, if you have a computer, a digital modes interface (something like a Rigblaster or Signalink) and the software (DM780 would be one), you would be surprised at how helpful they can be. I used this setup when aligning my Wilderness Sierra rig and it really worked well.

In my case, my previous alignment made it such that narrowing the crystal filter on my Sierra made signals disappear (it wasn't centered).

The waterfall display really helped when adjusting the BFO because I could literally see the passband.

On 40 meters with no antenna connected, the ambient noise worked well as a 'semi' white noise source.

So, if you have the equipment, this is something else you can try. It has worked great for me.

One more note:

Actually, in my case I didn't even use a sound card interface. I just ran the earphone output straight into the sound card microphone jack. It worked great. (Sorry cobwebs).

From: Etienne Scott
Topic: 10130 Message: 10130

All (but especially Steve W.) -

I see in the MTR Manual that the maximum voltage specification for the MTR is 12.0 volts. And I've read several places that that maximum should not be exceeded. I thus read the "point zero" very literally.

HOWEVER, I just realized that AA alkaline cells are nominal 1.5 volts but when brand new are more like 1.6 volts. Using eight fresh cells would provide 12.8 volts, unloaded. And the receive load for the MTR is tiny and would do little to reduce that voltage.

QUESTION: Is it safe to operate an MTR radio with eight NEW AA alkaline cells at ~12.8 volts??

Thanks,
Etienne, K7ATN

10131. RE: [AT_Sprint] MTR Maximum Voltage?

The exact fail voltage would be more accurately measured at the finals. However, I'm pretty sure that you aren't going to be wanting to carry around a lab accurate voltmeter. The concern is for the finals first, and the rest of the radio also. The usual failure is when tx, with a high voltage power source, and a tuner, or antenna that presents a very high swr to the finals thus raising the voltage at the final juctions. Interminttant antenna connections are very guilty,or arcing in a tuner. One easy cure would be to tune up with one cell removed, replaced with a shorting dummy cell... or.. use a "tuneup" switch, that would add into the powerlead a 5 ohm resistor. That would drop the voltage to the radio to a "safe to tuneup" voltage. You could also use a 9.6 volt pack. Many many times I have forgotten to go back to high power with mine, and had the battery last a whole lot longer. Good Luck,

Topic: 10130 Message: 10132

After the concerns raised long ago on the safe(r) voltage for the ATS-4 being around 9 vdc (particularly when tuning into an unknown antenna... though using a Tayloe bridge when doing so at least keeps a more safe constant load)...

I built a small regulator circuit on vectorboard with a 7809 regulator (with heatsink) and the suggested capacitors to go between my power source and the rig.

This will deliver a constant 9 vdc in xmit and receive, no matter if I am using my home/deck, based 13.8 vdc power supply or my 12 vdc UPS-pulled battery (7 Ah big, but OK to carry to deck or beachhead or park), or if I use my 10-cell AA pack.

10133. QST QST QST Second plug - Team members needed for NAQP (CW)Jan 12, 2013

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-11 05:19:48 UTC
From: Hank Greeb
Topic: 10133 Message: 10133

The first solicitation back in September netted the following potential volunteers - WC7S, K8CV, N6GA, AA4GA, N1OA, and me.

We could use up to an infinite number of suckers... errr, volunteers to partake in informal "teams". To refresh your memories:

The North American QSO Party (NAQP) CW version will be held next year, Saturday, January 12, starting at 1800Z and ending Sunday, January 13, 0600Z. Six of us had a ball during the August 2012 event, yes, we REALLY did have fun. See our article about this at the web site: http://w8dc.org/grr_images/Greeb2.pdf

So much fun that I'd like to expand even more to any sucker... errr...., volunteer who would like to join a team (or teams) for the upcoming January 2013 CW NAQP. The only requirement is that you'd agree to run QRP with whatever kind of rig you prefer to use. We already have enough for one team of 5, but there's no limit to the number of teams we can have. If we have 5 rigs of the same kind, I'd make a team of those folks. If we have more than 5 rigs of the same kind, there'd be 2 (or more) teams. We can mix types of rigs for "full" teams of 5 each - it really doesn't matter.

The "interesting" part of NAQP, for the QRP op, is that it's a "semi-real" contest. It's not all blood and guts, because it is limited to 100 watts for entrants. So, rigs running 5 watts like the AT-Sprint or similar with a pair of '602's or '612's for first mixer and product detectors won't suffer from large signals overwhelming the front end. If you have a KX-3, K3, K2, or similar, that's Fine business. Or, if you have a 100 watt rig which you can crank down to 5 watts, that's great! It's the power level, not the rig type, which is important.

So, if you think you might be available for part or all of the period of 1800Z, 01/12/13 to 0600Z 01/13/13 please let me know. You needn't commit completely, but I'd like to add to the list of folks who "probably" could join such an endeavor. Part timers and operators of any ability level are cordially invited. We had one op who make >250 Q's, and one who made 4 Q's (because of family duties which got it the way of participation).

For those who are interested, rules for these QSO Parties are at http://ncjweb.com/naqprules.pdf

Please advise by private e-mail. I'll put you on the list, and remind you early in 2013 to confirm your availability.

72/73 de n8xx Hg

p.s. Note - the upcoming QRP ARCI Holiday Homebrew Sprint, this coming Sunday, can be used as a good practice session for the NAQP!

10135. Re: MTR Maximum Voltage?

Yahoo group: AT_Sprint (2012 — 2013)

From: ve3wmb
Topic: 10130 Message: 10135

Etienne :

I built a "poor man's voltage regulator" into a small plastic box that also includes a fuse. I just connect this between the AA battery pack and the my ATS-3 rig using molex connectors. What it consists of are a couple of silicon diodes in series. Each diode will drop
about 0.6 to 0.7 V. I have a SPST switch across one of the diodes so that I can short it out (effectively bypassing it) once the battery has been used for a bit and the voltage has dropped. This allows me to maintain a voltage of < 12V with minimal fuss and provides a convenient point to fuse the leads from the battery. I check the battery voltage before going out to operate so I know whether I need one or both diodes in line.

I also make use of 10V AA NiMH packs designed for R/C models. These can sometimes be found on sale at Radio Shack along with a charger. Fully charged they are probably closer to about 11 V so they make a good pack for ATS-series and MTRs. I cut the original leads and install pico fuses. I then cover the fuses/leads with heat-shrink tubing and tape them against the side of the pack for mechanical stability. Another option would be to use AA NiMH cells in your 8 cell holder.

A couple of additional points regarding NiMH; they don't like to be cold and they have a fairly high self-discharge rate so it is best to charge them the night before a planned outing.

I enjoyed my AT-Sprint NAQP team experience, but this time around I'm not planning on using the AT rig, but my new KX3...I don't think we're *necessarily* looking at rig-specific teams, although that is a possibility. I think the main thrust is QRP teams.

Correct me if I'm wrong Hank...

Hank-
Count me in. The NAQPs are a blast. I typically work both the CW & RTTY ones as QRP but, missed the August NAQP due to other commitments. I will use my trusty ATS3 unless I get the time to build the ATS4b before then. Other projects in the queue though...

Subject: [AT_Sprint] QST QST QST Second plug - Team members needed for NAQP (CW)Jan 12, 2013

The first solicitation back in September netted the following potential volunteers - WC7S, K8CV, N6GA, AA4GA, N1OA, and me.

We could use up to an infinite number of suckers... errr, volunteers to partake in informal "teams". To refresh your memories:

The North American QSO Party (NAQP) CW version will be held next year, Saturday, January 12, starting at 1800Z and ending Sunday, January 13, 0600Z. Six of us had a ball during the August 2012 event, yes, we REALLY did have fun. See our article about this at the web site: http://w8dc.org/grr_images/Greeb2.pdf

So much fun that I'd like to expand even more to any sucker... errr...., volunteer who would like to join a team (or teams) for the upcoming January 2013 CW NAQP. The only requirement is that you'd agree to run QRP with whatever kind of rig you prefer to use. We already have enough for one team of 5, but there's no limit to the number of teams we can have. If we have 5 rigs of the same kind, I'd make a team of those folks. If we have more than 5 rigs of the same kind, there'd be 2 (or more) teams. We can mix types of rigs for "full"
teams of 5 each - it really doesn't matter.

The "interesting" part of NAQP, for the QRP op, is that it's a "semi-real" contest. It's not all blood and guts, because it is limited to 100 watts for entrants. So, rigs running 5 watts like the AT-Sprint or similar with a pair of '602's or '612's for first mixer and product detectors won't suffer from large signals overwhelming the front end. If you have a KX-3, K3, K2, or similar, that's Fine business. Or, if you have a 100 watt rig which you

can crank down to 5 watts, that's great!
It's the power level, not the rig type, which is important.

So, if you think you might be available for part or all of the period of 1800Z, 01/12/13 to 0600Z 01/13/13 please let me know. You needn't commit completely, but I'd like to add to the list of folks who "probably" could join such an endeavor. Part timers and operators of any ability level are cordially invited. We had one op who make >250 Q's, and one who made 4 Q's (because of family duties which got it the way of participation).

For those who are interested, rules for these QSO Parties are at http://ncjweb.com/naqprules.pdf

Please advise by private e-mail. I'll put you on the list, and remind you early in 2013 to confirm your availability.

72/73 de n8xx Hg

p.s. Note - the upcoming QRP ARCI Holiday Homebrew Sprint, this coming Sunday, can be used as a good practice session for the NAQP!

We ain't being specific on the rigs, anyone with a rig and who sez he/she will operate QRP is welcome. If we have 5 similar rigs, we can name the team as "FT-817'ers" or "Elecraft Team" or "Ten-Teckkies" or "Homebrew QRPers" etc. I'm sure we won't win in the team "competition" but we might as well show that QRP can do a credible job.

Check out the August preliminary results at:
http://ncjweb.com/naqpcwprelim.php

Note the top 5 QRP ops had between 350 and 450 Q's in the 8 hour contest. None of us "AT-Sprinters" did that well, but we weren't in the contest for "blood and guts."

Let me know the rig you decide to use, so I can sign you up for the appropriate team.

Yan -

Thanks for digging these numbers up.

However, I like the one data point you sent me earlier that had an efficiency of 75%. The numbers below range from 79% efficiency on up to 101%. I know that Weber designs great radios but I don't know that energy creation is one of the features.

Still, it gives me a good understanding of the current draw of the MTR and thus what battery life would be like.

Etienne.

10148. Re: [AT_Sprint] Re: MTR Transmit Current?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-12 01:03:09 UTC
From: Scott Cowling
Topic: 10082 Message: 10148

Hi Etienne,

After I re-read my prior measurements that Yan reposted, I agree with you. The transmitter efficiency cannot really be approaching (or more than) 100%. So I took new measurements using a wattmeter with more resolution (and hopefully more accuracy). I used a Keithley DMM and a NorCal QRP wattmeter to measure the following on my MTR 20/40 s/n 004:

40M: 8.0V@483mA = 2.3W (60% efficiency)
40M: 10.0V@585mA = 3.6W (62% efficiency)
40M: 12.0V@683mA = 5.1W (62% efficiency)

20M: 8.0V@520mA = 2.8W (67% efficiency)
20M: 10.0V@653mA = 4.0W (61% efficiency)
20M: 12.0V@774mA = 5.5W (59% efficiency)

These look more reasonable. Interesting that I get better power out on 20M. Hmmm....

I can also measure at 9V if anyone is interested in that data point.

Of more interest might be 11.0 v, as many of the 3-cell Li-based batteries run about 11.1v

Maybe run 9 and 11, then have the whole thing bracketed and done. Until someone asks for 12v <grin>. And don't be surprised if someone suggests 14v (13.8v gel-cell).

I had a detailed response written for this and then lost it due to an Internet glitch! Just a word of caution here. Although 3-cell LiPOs are rated at 11.1V, that is the MINIMUM voltage they should ever be discharged to (i.e. 3.7V per cell). Discharging lower will KILL them. They're typically charged to 4.2V per cell so a 3-cell will be 12.6V at maximum charge, which is a little high for ATS rigs. You have several options:

1. Use only a Tayloe bridge tuner to ensure low SWR. (Emtech ZM-2, Hendricks SOTA Tuner, etc). I've never had any problems running 12.6V with my ATS-3 into properly matched loads. A separate 9V battery can also be as a "tune-up" power source if you don't have a Tayloe bridge.

2. Charge LiPOs initially to only 12V. This is easy since you MUST use a smart balancing charger for LiPOs. You aren't giving away much capacity since the discharge curve is very rapid from 12.6 to 12.0 (black line below):

http://www.maximintegrated.com/images/appnotes/3958/3958Fig05.gif

3. As Fred KT5X does, add a switchable diode to drop the voltage for the first few QSOs and monitor the voltage using #6 below to switch it out when the voltage drops to 12.0.

LiPOs offer the best energy/weight ratio for portable operating but you MUST carefully follow the rules for charging, discharging, storage, etc. Here's a primer for anyone considering LiPOs. Knowledge is an absolute MUST for properly using LiPOs:

http://www.rchelicopterfun.com/rc-lipo-batteries.html

I bought my setup from Chinese suppliers on eBay. Here's a basic collection of what you'll need:

1. Fireproof charge bag - $4.68. (Not absolutely necessary IMHO but a good idea if you do indoor or unattended charging.)

2. 11.1v 1200mah 20C BQY lipo battery - $11.98 (I bought two).

3. JST connector plug RC BEC lipo - $0.99 (connector for most smaller capacity LiPOs and you'll add #5 below to connect to your ATS).

4. Imax B6 2-6 cells Lipo NiMh Digital Balance Battery Charger - $20.98 (Absolute MUST for balanced charging of LiPOs)

5. New 2.5mm x 0.7mm DC Power cable Male Plug Connector - $0.99 (for ATS power input)

6. 2-6 cells LED 2S-6S Checker Tester - $2.95 (monitors each cell and total voltage so you don't discharge too far which will KILL your battery)

Total system cost is about $50 for one 1200 mAh battery or $60 for two.

IMHO LiPOs work very well for ATS rigs but you must know what you're doing. Read and RE-READ the link above before you start using these batteries!

10153. MTR Transmit/Receive Current Table

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-12 18:42:10 UTC
From: Scott Cowling
Topic: 10153 Message: 10153

Hi all,

Here is my updated table that includes all of the measurements on my MTR 20/40 s/n 004. I used a Keithley DMM and a NorCal QRP wattmeter.

RX current, all voltages: 32mA

Total current during TX:

40M: 8.0V@483mA = 2.3W (60% efficiency)
40M: 9.0V@538mA = 3.0W (63% efficiency)
40M: 10.0V@585mA = 3.6W (62% efficiency)
40M: 11.0V@639mA = 4.5W (64% efficiency)
40M: 12.0V@683mA = 5.1W (62% efficiency)

20M: 8.0V@520mA = 2.8W (67% efficiency)
20M: 9.0V@520mA = 3.1W (64% efficiency)
20M: 10.0V@653mA = 4.0W (61% efficiency)
20M: 11.0V@742mA = 4.8W (59% efficiency)
20M: 12.0V@774mA = 5.5W (59% efficiency)

I suspect that the non-monotonic changes in efficiency on 40M are due to the 100mW resolution of my wattmeter.

Yes, the TX current is the same on 20M at both 8.0V and 9.0V; I measured it twice, since it looked odd.

73,
Scotty WA2DFI

That happens when the rig is in Straight key mode, as all those options only work with a paddle. If your stuck in that mode, (nothing in the jack) it usually means that the Dash input port got damaged somehow and the processor needs to be replaced, although there is the slim chance the pull up resistor for that port isn't making contact anymore, maybe one end didn't get soldered.

I think you are being overly cautious if you only discharge a 3-cell LiPo to 3.7V. At that point the battery is charged to about 80% capacity. 3.2-3.4V is a reasonable low limit. The "MINIMUM" is probably 3.0V or even lower. IMHO. - N1FJ

Topic: 10082 Message: 10157

I'm no expert in this, in the first reference below I'm seeing conflict between advice:
http://www.rchelicopterfun.com/rc-lipo-batteries.html

"I am often guilty of going past that 80% (3.75V per cell) number down to 90% (about 3.7 volts per cell) while flying, and on most decent quality packs if they are not being worked that hard - this is usually ok - at least in my experiences."

This reference seems to suggest that 90% discharge is recognized when the battery cells are down to 3.7V.

http://www.rcgroups.com/forums/showthread.php?t=209187

LiPolys act differently than NiCad or NiMH batteries do when charging and discharging. Lithium batteries are fully charged when each cell has a voltage of 4.2 volts. They are fully discharged when each cell has a voltage of 3.0 volts. It is important not to exceed both the high voltage of 4.2 volts and the low voltage of 3.0 volts. Exceeding these limits can harm the battery.

This reference suggests that discharge to a value above 3.0V is acceptable, and that damage starts at 3.0V.

http://en.wikipedia.org/wiki/Lithium_polymer_battery

During discharge on load, the load has to be removed as soon as the voltage drops below approximately 3.0 V[citation needed] per cell (used in a series combination), or else the battery[citation needed]will subsequently no longer accept a full charge and may experience problems holding voltage under load. Li-poly batteries can be protected by circuitry that prevents over-charge and deep-discharge.

Wikipedia and rcgroups seem to agree. Discharge at or below 3.0 is likely to cause damage.

Am I missing something? What is the first reference based on and why the difference?

10158. Re: MTR Transmit Current?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-13 15:47:36 UTC
From: zigmundrat
Topic: 10082 Message: 10158

The first reference (discharge limit of 3.7 or 3.875 v/cell) is pretty much untrue - it's incredibly conservative. The others stating a max of 4.2 and a min of 3.0 are correct. Beyond those limits and you are looking at damaging the batteries. In fact, most chargers will refuse to start charging a LiPo cell if it's below 3.0v. In RC aircraft, we usually set the low voltage cutoff to a value somewhat above 3.0 - say, 3.3 or 3.4 but the exact value is a bit arbitrary. The reason is that we need to have reserves and the ability to control and land the aircraft safely. And there's no reason to abuse the batteries.

For use with MTR, charging a 3S LiPo with a 'storage' charge would probably be safest. This brings each cell to about 3.8v (can vary a bit). This will still run an MTR for a long time. You could also consider LiFe batteries - these provide a nominal 3.3v/cell, have a very flat discharge curve, and can discharge to 2.0v although they are mostly depleted at 2.5v. I'm not sure how well these radios behave at those voltage levels though (think of the low end at 7.5v).

Also note that Li-ion and Li-poly are different, and different rules apply, so be careful about confusing the two.

10159. [AT_Sprint] MTR Transmit Current? (really, LiPO batteries)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-13 15:55:01 UTC
From: cloud runner
Topic: 10159 Message: 10159

You have it right.

Critical voltage in a LiPO is 3.0 volts. In a 3S configuration, that equates to 9 volts.

Note that the flat voltage zone is from about 3.7 volts to about 3.3 volts per cell. Just like there is little current stored in voltages higher than this flat zone, there is little current stored below it. In other words, if a 3S LiPO gets below 10 volts, its voltage will drop-like-a-stone.

Don't go there!

All of that said, while using an ATS radio which draws only about 40 mA in rcv, a typical 30 QSO SOTA activation consumes between 250 and 300 mAH. this is enabling me to use a battery that weighs two ounces!

Thanks to these wonderful little radios, my entire set up including antenna wire supporting pole now weighs under a pound and a half. If I can use trees entirely, and leave the pole at home, under one pound!

I agree Frandy. I have been told that draining them below 3.0 is the beginning of the danger zone.

One of the other questions I asked was what about dips below 3.0v/cell under quick loads. What I was told was that the battery should not be drained below 3.0v for a steady unloaded state. Quick dips below that happen all the time on model aircraft, and while certainly were not the best way to treat the battery, as long as the voltage was above 3.0v/cell unloaded, it isn't likely anything was severely damaged.

I asked that because my FT-817 could pull that to about 2.4v under a 5-watt load before shutting the radio off. What I have not yet determined is what the unloaded voltage would be after my FT-817 shut down under load from a weak battery.

I have two 3600mah Li-Po batteries that fit inside the FT-817. They last so long I have yet to run one low enough to see where they run out at under 5-watt (about 2000 mah load).

You're correct...3.0V is the "discharge voltage cutoff level" according to my charger manual. I believe about 3.3 or 3.4 is the 50% capacity level which is recommended for storage (at refrigerator temps...not the freezer). I select STORAGE and the charger discharges to whatever level that is and put them in a baggie in the fridge.

Although 3-cell LiPOs are rated at 11.1V, that is the MINIMUM voltage they should ever be discharged to (i.e. 3.7V per cell). Discharging lower will KILL them. They're typically charged to 4.2V per cell so a 3-cell will be 12.6V at maximum charge, which is a little high for ATS rigs. You have several options:

10163. Re: [AT_Sprint] Re: MTR Transmit Current?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-14 05:27:27 UTC
From: Steven Weber
Topic: 10082 Message: 10163

I'm not sure how well these radios behave at those voltage levels though
(think of the low end at 7.5v).
>

The rig will work just fine until the 5V regulator goes out of regulation,
which will happen at about 5.5 volts. Power out will be a bit low, 500 mw or
so, but still useable.

From: radio_kx0r
Topic: 10153 Message: 10164

Scotty -

Your numbers are believable and pretty close to what I'm seeing here. I spent the morning doing tests on my new MTR, and you and I are seeing about the same efficiency.

I set my radio up for 20M and 30M. I was able to adjust the toroids so that I see these numbers:

30M 6.0V .35A 1.2W out 57% eff
30M 9.1V .50A 2.9W out 64% eff
30M 12.0V .65A 5.0W out 64% eff

20M 6.0V .37A 1.2W out 54% eff
20M 9.1V .53A 3.0W out 62% eff
20M 12.0V .68A 5.1W out 52% eff

No complaints here !! The efficiency is the whole radio overall, so the efficiency of the final stage is significantly higher.

The voltages and currents are measured with a Fluke 77 and the MTR itself. The voltages are measured in receive mode, so they are sagging a tenth or two when the rig is keyed - I'm using a regulated supply on the bench, but the leads are a couple of feet long. So the actual efficiency would measure better if we checked the voltage right at the pcb when the rig is keyed. The RF power meter is a WM-2 which has been checked carefully against a Norcal SMT dummy load with its schottky detector.

Some of the other measurements posted here look like some people need to check or calibrate their instruments. The rig current had better not be even close to 1A! Nor should the efficiency be impossibly great!

When I first tried adjusting the transmitter toroids, I found that I had lower output on 30M than on 20M. After some adjusting, I decided to increase the turns on L13. In the manual it looks like the 14 turns recommended for L13 isn't proportional like the other toroids are for 40M and 20M.

I increased L13 from 14T to 17T, and I had over 6 watts at 12V instantly. Woah! I cut it back to 16T, and after adjusting L12 and L13, I was able to get 5.0W at 12.0V with good efficiency.

But today I made a serious discovery: I checked the drain waveforms on the final mosfets to see what the peak voltages were. On 20M the peaks are hitting about +39V with 12.0V in and 5.1W out. That seems OK, as it provides some margin in case the SWR isn't perfect. We don't want those RF peaks to approach the 47V level, because zener diode D4 would start clipping and wasting power - or worse, overheat and short. On 30M with 12.0V and 5.1W out, with 16T on L13, I saw the peaks hitting +46V, so I adjusted the coils some more to try to get that down. In the end I reduced the turns on L13 to 15 turns, re-adjusted L13 and L12 back and forth, and ended up with the peak drain voltage at +39V on 30M, with the numbers above!

Success!

The 30M numbers above are with 15 turns on L13 and everything adjusted. I should mention that I increased the wire gage on all the toroids from #28 (supplied) to #26. Not sure this matters much.

So if your output on 30M is low, try adding a turn to L13. No more.

Because of what I saw with those high peaks on the drains of the finals, I would caution anyone planning to run their MTR at 12V to use a high-frequency scope to check the drain waves on both bands before assuming that everything is great, just because the power out and efficiency are nice. It may be that adjusting for efficiency or power out can push the drain voltage peaks up in some cases. I don't pretend to understand the complex relationship between the many variables in the transmitter output filter, but I do know that you don't want those drain peaks anywhere near 47V !! D4 is there for protection of the drains in case you forget to hook up the coax for a moment, or whatever, not for regular operation.

After I had everything adjusted, I checked the spectrum on my HP141T. The worst spurious emissions are the 2F harmonics. These are -50 dbc on 30M and -49 dbc on 20M, with both 9V and 12V. That's nice. 3F is a few db lower. All the higher harmonics to 100 MHz are further down.
There are some other products near or below the main frequency that are -50 dbc or better on 20M, and -55 dbc or better on 30M. No complaints here either!

Nice job Steve!!

The receiver is equally impressive. I can hear signals way below 0.1 uV on both bands, and on 20M I can just hear 30 nV. At 0.1 uV the signals would be Q5 if the noise level was as low as on the bench.

I still haven't put it on the air, but the receiver does what it should.

This was a fun day...

Sorry this is so long, but I told the whole tale so the ones of you who want to peak up your MTR can have a pretty good set of data to compare with. If you just buzzed through it the first time, you might want to take a second pass and adjust those toroids (compress or spread the turns to vary the inductance) while you measure all the numbers.

10165. 5 volt phone power packs for QRP transceiver use.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-12-17 20:19:42 UTC
From: jor
Topic: 10165 Message: 10165

Hi all,

There are many powerful Li-po battery packs available on the market for mobile phone backup purpose and affordable.
Bud most off them are 5 volt up to 3 Amp/h or more and have a regulator electronics inside for charging so the are safe to use. May be we have to design the QRP sets for 5 volt operation and built in a up converting switcher to power de PA with 9 or 12 volt during transmission period?
Any experience with this set up?

The Four State QRP Comfortable nets meet each Wednesday night
beginning at 7:00 PM CST, 0100z.

The 80M nets have had excellent participation and tonight I'm going to
try to move them along more quickly by taking a list after calling CQ.
I'll acknowledge you with your call and add the prosign AS. After the
list is taken, I'll come back to each of you for the exchange. When
the first list is run, we'll take another one. Thanks for trying this
out, it should be fun..

If we have to QSY, I like to move up, Wayne likes to move down,
and Dick doesn't have to move much at all.

Add anything to the exchange that you wish, temp rig, ant, etc.

7:00 CST 0100z ... 80M CW Net on 3564, WA?ITP NCS.
7:30 CST 0130z ... 40M CW Net on 7122, KC?PMH NCS
8:00 CST 0200z ... 80M CW Net on 3564, WA?ITP NCS.
8:30 CST 0230z ... 40M CW Net on 7122, KC?PMH NCS
9:00 CST 0300z ... 80M PSK Net on 3580.5, N?TGR NCS

All are welcome! After the nets, a list of checkins is posted on
Four State reflector. If you aren't already receiving postings,
go here to sign up. http://www.4sqrp.com/reflsub.php

I love this radio stuff !

From: johnroland51
Topic: 10169 Message: 10169

I finally got around to assembling my MTR by hand soldering. I'm trying to troubleshoot some problems, there appear to be many, but I'm hoping maybe they are all related.
I'm getting continuity between the metal top of U11 and pin 2 which is grounded. While I can't really see a bridge between pin 2 and the case, Steve cautions to avoid solder bridges on U11 on page 6 of the manual. I'm wondering if the case might be internally connected to pin 2. Thought I'd check before ordering a new u11.
Thanks
John

I don't think you have a problem with that.. I can measure one, if we need to.The concern with U11 is more that it is oriented correctly. The shorts on the regulated supplies 3.3 and 5.. are not a good thing.. they can be checked with an ohmmeterpreliminarily then with a voltmeter after power is applied. What seems to be the issues?

Have a great day,

From: radio_kx0r
Topic: 10169 Message: 10171

John,

Short from pin 2 to metal top of U11 is OK. Top of Ull on my working MTR is connected to ground.

Suggest you visually inspect the whole rig, especially U6 and U10, using the following tools:

1) Bright light - spot lamp or other high-intensity source - up close to the board
2) Magnification - sufficient to judge whether the tiny joints are soldered, bridged, or open
3) Change the light and the direction you look, so you view at more than one angle - try to look under the leads and other parts - look for gaps.

Be sure to clean off all the flux per the instructions in the manual - otherwise the inspection is likely to be of little value. I found that gentle use of a short-bristle brush (so-called "acid brush", clipped down to about 1/4") with denatured alcohol, followed by Q-tips (cotton swabs) with a little more alcohol to soak up the residue, was effective.

If any of the tiny pins on the IC's are bent, they may look OK but may not actually be soldered to the pads.

Check to be sure that all IC's and other polarized parts are oriented per the charts in the manual.

Be sure to check the three supply voltages in the rig. The two regulators should be very close to their specs.

Whatever you do, don't do what I did:

I had the DC power connector, the headphone connector, and the paddles connector all connected by short leads to the PCB. I failed to insulate the solder pins on the power connector. While turning the board over to adjust trimmers, the power connector touched the paddles connector. This allowed 9V to connect to the paddle input of the micro processor. That destroyed part of the processor. Bad mistake.

Please insulate your connectors while doing tests and measurements. A piece of tape or sleeving will work.

Avoid slipping with meter or scope probes.

If you can't see and correct any problems, perhaps you should try measuring the voltages on various pins using the charts in the manual.

It is true that these radios usually work well, once all the solder connections are correct. Once you get your MTR going, your patience will be rewarded!

Good luck,

Carey

One other thing I've found helpful is if you have a document scanner, scan a board and you'd be surprised as to resolution you can see on your computer monitor. With my old HP scanner it yields a very clear magnified image. It ends up 30 to 50mb using SANE in my linux box but is very clear.

Print the image in gray scale and you can keep track of tests so you don't miss something.

From: Dale Putnam
Topic: 10175 Message: 10175
Attachments: 3 described; binary payloads are missing from this source WARC

The
True Story of Rudolph

A
man named Bob May, depressed and brokenhearted,
stared out his drafty apartment window
into the chilling December
night.

His
4-year-old daughter Barbara sat on his lap
quietly sobbing. Bob's wife, Evelyn, was dying
of cancer Little Barbara couldn't understand why
her mommy could never come home. Barbara looked
up into her dad's eyes and asked, "Why isn't
Mommy just like everybody else's Mommy?" Bob's
jaw tightened and his eyes welled with tears.
Her question brought waves of grief, but also of
anger. It had been the story of Bob's life.
Life always had to be different for
Bob.

Small
when he was a kid, Bob was often bullied by
other boys. He was too little at the time
to compete in sports. He was often called names
he'd rather not remember. From childhood, Bob
was different and never seemed to fit in. Bob
did complete college, married his loving wife
and was grateful to get his job as a copywriter
at Montgomery Ward
during the Great Depression. Then he
was blessed with his little girl. But it was all
short-lived. Evelyn's bout with cancer
stripped them of all their savings and
now Bob and his daughter were forced to live in
a two-room apartment
in the Chicago slums. Evelyn died
just days before Christmas in
1938.

Bob
struggled to give hope to his child, for whom he
couldn't even afford to buy a Christmas gift.
But if he couldn't buy a gift, he was determined

to make one - a storybook! Bob had created an
animal character in his own mind and
told the animal's story to little
Barbara to give her comfort and hope. Again and
again Bob told the story, embellishing
it more with each telling. Who
was thecharacter? What
was the story all about? The story Bob
May created was his own autobiography in fable
form. The character he created was a misfit
outcast like he was. The name
of the character? A little reindeer
named Rudolph, with a big shiny nose. Bob
finishedthe book just in time to give it to
his little girl on Christmas Day.
But the story doesn't end there.

The
general manager of Montgomery Ward
caught wind of the little storybook
and offered Bob May a nominal fee to
purchase the rights to
print the book. Wards went on to
print,_ Rudolph, the Red-Nosed
Reindeer_ and distribute it to children visiting
Santa Claus intheir stores. By 1946 Wards had
printed and distributed more than six million
copies of Rudolph. That same year, a major
publisher wanted to
purchase the rights from Wards to
print an updated version
of the book.

In
an unprecedented gesture of kindness, the
CEO of Wards returned all rights back to Bob
May. The book became a best seller. Many toy and
marketing deals followed and Bob May, now
remarried with a growing family, became wealthy
from the story he created to comfort
his grieving daughter. But the story
doesn't end there either.

Bob's
brother-in-law, Johnny Marks, made a song
adaptation to Rudolph. Though the song
was turned down by such popular vocalists as
Bing Crosby and Dinah Shore , it
was recorded by the singing cowboy,
Gene Autry.
"Rudolph, the Red-Nosed Reindeer" was

released in 1949 and became a phenomenal
success, selling more records than any other
Christmas song, with the exception of
"White Christmas."

The
gift of love that Bob May created for his
daughter so long ago kept on returning back to
bless him again and again. And Bob May
learned the lesson, just like his dear
friend Rudolph, that being different isn't so
bad. In fact, being different can be a
blessing.

MERRY

> A man named Bob May, depressed and brokenhearted, stared out his drafty apartment window into the chilling December night.
>
> His 4-year-old daughter Barbara sat on his lap quietly sobbing. Bob's wife, Evelyn, was dying of cancer Little Barbara couldn't understand why her mommy could never come home. Barbara looked up into her dad's eyes and asked, "Why isn't Mommy just like everybody else's Mommy?" Bob's jaw tightened and his eyes welled with tears. Her question brought waves of grief, but also of anger. It had been the story of Bob's life. Life always had to be different for Bob.
>
> Small when he was a kid, Bob was often bullied by other boys. He was too little at the time to compete in sports. He was often called names he'd rather not remember. From childhood, Bob was different and never seemed to fit in. Bob did complete college, married his loving wife and was grateful to get his job as a copywriter at Montgomery Ward during the Great Depression. Then he was blessed with his little girl. But it was all short-lived. Evelyn's bout with cancer stripped them of all their savings and now Bob and his daughter

were forced to live in a two-room apartment in the Chicago slums. Evelyn died just days before Christmas in 1938.
>
> Bob struggled to give hope to his child, for whom he couldn't even afford to buy a Christmas gift. But if he couldn't buy a gift, he was determined to make one - a storybook! Bob had created an animal character in his own mind and told the animal's story to little Barbara to give her comfort and hope. Again and again Bob told the story, embellishing it more with each telling. Who was thecharacter? What was the story all about? The story Bob May created was his own autobiography in fable form. The character he created was a misfit outcast like he was. The name of the character? A little reindeer named Rudolph, with a big shiny nose. Bob finishedthe book just in time to give it to his little girl on Christmas Day. But the story doesn't end there.
>
> The general manager of Montgomery Ward caught wind of the little storybook and offered Bob May a nominal fee to purchase the rights to print the book. Wards went on to print,_ Rudolph, the Red-Nosed Reindeer_ and distribute it to children visiting Santa Claus intheir stores. By 1946 Wards had printed and distributed more than six million copies of Rudolph. That same year, a major publisher wanted to purchase the rights from Wards to print an updated version of the book.
>
> In an unprecedented gesture of kindness, the CEO of Wards returned all rights back to Bob May. The book became a best seller. Many toy and marketing deals followed and Bob May, now remarried with a growing family, became wealthy from the story he created to comfort his grieving daughter. But the story doesn't end there either.

Hi Steve, I am a new licensed OM and probably I will receive my call sign in january-febrary.
In these months I am studying and learning cw and I am loving it, so I'd like to have a your kit and I need to know if is possible sending it to Italy or do it using my Fedex account (I have it for job).

Another question, can you explain me differences between MTR and ATS3?

Thank you very much and 73
Cristiano

Dear Cristiano,

Currently Steve have no stocks for any kit.
He will announce a new batch of around 100 Mountain Topper Rig kigs around february.
You should watch this list and once the kits availability is announced order yours quickly as they all will be sold in less than 48 hours.
Of course Steve can ship it to Italy. I received mine in Viet-Nam...

The ATS-3 is an older version of a similar design. The MTR includes several improvements.
The main difference is that the ATS-3 used pluggable band modules allowing you to change the band for transmission/receiving.
The MTR only has 2 bands that you have to choose at construction time.
Personally I prefer the "2 fixed bands" design of the MTR as :
- when going portable I don't take 10 antennas or a big antenna tuner
- pluggable modules can be fragile and are a source for bad contacts and possible troubles
- with two bands you can have "daytime band" (20 meters) and one "night band" (30m or 40m)

Please notice that these kits are not easy one to assemble.
Soldering SMT parts is something that need good experience and patience.
This transceiver being really compact, they are not the easiest to troubleshoot either.
If it is your first kit, you should try something else.
If you are experience with electronic, then you will see that they are great to build (superb design and part quality) and great to use.

Best seasons greetings,
73,
Yan.

Hello to all
I understand the demands of our friend, I bought a ATS 3B used and I am very satisfied with this unit
It is simple and effective, and 4 bands it is great for the price.
we no longer talk much older ATS on the list, two bands is a bit limited I think.
I even sold my pfr3 a friend who insisted to have a lot ... because it is small and lightweight you can easily put a sota tuner
or something to tune the antenna.
There is no bad contacts and if this is the case, it is easy to tighten a little pin with a needle.
I think I'd be interested to put it in a box a little more solid and replace connecterur power and put a BNC or SMA antenna.
BS170 can be also a day if there is a problem with the PA
This is in no hurry ...
but otherwise it is very much like that

10182. Re: [AT_Sprint] Re: MTR kit

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-01-27 14:42:24 UTC
From: Hank Greeb
Topic: 10174 Message: 10182

Thanks, Jean-Paul:

I, too, have a "grand-daddy" of the AT-Sprint series. Mine is the original, no suffix, 40, 30, 20 meters. It claims to have somewhat higher power consumption at 55 ma on receive. The pins on the modules are smaller than in the later series, and occasionally bend if I don't get them aligned correctly before trying to seat them, but they haven't broken. The unit was built in 2003, and is still very functional.

Any AT-Sprint one can find for sale on this list and on e-Bay should be a very satisfactory rig. The newest rigs have 80/40/30/20/17/15 meters, which offer high versatility. Some of these can run PSK-31 and some other modes with a change in programming of the firmware. All of these features are described in the files section of this Yahoo Group.

If you don't feel up to the task of building, or diagnosis and repair, several people offer building and repair services.

My recommendation, if you are in a hurry, watch for the new MTR kits. If you want maximum versatility, find a built AT-Sprint (any model) or kit for sale here or on e-Bay. You won't go wrong either way.

QRP >99.44% of the time

==========

Merci, Jean-Paul:

Moi aussi, avoir un "grand-p?re" de la s?rie AT-Sprint. Le mien est l'original, pas de suffixe, 40, 30, 20 m?tres. Il pr?tend avoir la consommation d'?nergie un peu plus ?lev?e ? 55 mA en r?ception. Les broches des modules sont plus petits que dans la s?rie plus tard, et parfois se tordre si je ne re?ois pas les aligner correctement avant d'essayer de les si?ge, mais ils n'ont pas rompu. L'appareil a ?t? construit en 2003 et est encore tr?s fonctionnel.

Toute AT-Sprint, on peut trouver ? la vente sur cette liste et sur e-Bay devrait ?tre une plate-forme tr?s satisfaisante. Les nouveaux appareils de forage ont 80/40/30/20/17/15 m?tres, qui offrent une grande polyvalence. Certains d'entre eux peuvent fonctionner PSK-31 et d'autres modes avec un changement dans la programmation du firmware. Toutes ces caract?ristiques sont d?crites dans la section des fichiers de ce groupe Yahoo.

Si vous ne vous sentez pas ? la hauteur du b?timent, de diagnostic et de r?paration, plusieurs personnes offrent des services de construction et

de r?paration.

Ma recommandation, si vous ?tes press?, regardez pour les kits MTR nouvelles. Si vous voulez un maximum de polyvalence, de trouver un construit AT-Sprint (tout mod?le) ou un kit ? vendre ici ou sur e-Bay. Vous ne vous tromperez pas de toute fa?on.

post-scriptum: Comment avez Google Translate faire?

Hello Henry
Yes the translation is done correctly
ok for the model before I had a connector ATS 3A weaker or smaller, mine is like an IC socket, no problem.
It is true that a unit with 4 bands without changing the plates is also good, but I would not give my ATS 3A to have a 2-band ...
I prefer to replace the cards with the filters, it is not very long ...
or else I will have to find a model four bands "opportunity"
What is lacking is a model 10 12 15 17 m H. I. :))

Hey Keith,

I'm sure you'll enjoy the ATS! If you've never done any SMD work before, you might want to think about a practice kit or two before tackling the ATS rig. I did one of the qrpkits dummy loads - really very easy with lots of room around the resistors...plus I got a nice DL out of it. I then went to a Softrock SDR kit. It was a little more challenging, but not bad at all - a good stepping stone up to the ATS. The ATS uses more, smaller, and closer-together parts than either of those I mentioned.

Have fun & GL,

From: cloud runner
Topic: 10188 Message: 10188

Did a SOTA today in New Mexico using an ATS3B powered by a 1,000 mAH LiPO battery. The 31 QSO half hour activation resulted in a new power consumption "personal record" of 4.87 mAH per QSO. It was probably less because I did not top off the battery before leaving, and it was last charged nearly two months ago.

Only used 151 mAH from the battery. Obviously, the battery was too big ;-) I have a smaller battery now, a 500 mAH, that I am going to begin to use instead.

73 & HNY,

Fred - KT5X

aka WS0TA when on a SOTA Peak

Fred, Knowing those SOTA QSOs aren't your average rag chew QSOs more likely 10-15 seconds if that. If this were case you could probably estimate you were burning approximately .33 mAH/second. Wow! now that's a green radio if there ever was one! And I bet you charged your battery with solar energy as well, right? ...Steve/wGOAT

--
Fred, Knowing those SOTA QSOs aren't your average rag chew QSOs more likely 10-15 seconds if that. If this were case you could probably estimate you were burning approximately .33 mAH/second. Wow! now that's a green radio if there ever was one! And I bet you charged your battery with solar energy as well, right? ...Steve/wGOAT

Hey Fred -

What voltage was your 1000 mAH battery pack? And who makes that one and the 500 mAH pack that you are using next?

Makes me think that running on 2500 mAH AA alkaline batteries would be overkill...

Thanks,
Etienne, K7ATN

I mentioned to Fred offline that I have over three hours operation on a
single Eveready 9v primary lithium battery in my ATS3b, and it's got
voltage left still...and that wasn't just RX, as I used it for Spartan
Sprints - lots of transmitting. I haven't done SOTA with the ATS yet, but
if you're a CW op, it's just about perfect for that. My hikes have been
pretty leisurely and I haven't worried much about weight, so I've used an
FT817, and a KX3 most recently...but plan to use the ATS later this year
from a mountain....could probably stuff everything in my pockets and not
even use a pack! ;-)

My 1,000 mAH LiPO was in the order of seven bux, Blue LiPO brand, from Hobbypartz dot com. It is a 3S in other words 11.1 to 11.6 for its flat area of discharge, BUT, fully charged it is 12.4 volts, and in working 31 QSO's it discharged all the way down to 12.0 volts !!! I have changed all my larger batteries to Anderson Powerpoles.

The 500 mAH came from the same source, but it is a Zippy Compact, brand. It weighs less that two ounces, and uses a small JST connector which I think I like more than Andersons for this service since they are so much less bulky.

We did do an experimental activation recently with an ATS4 and the 500 mAH battery. It discharged into its flat range, but only just barely, that is, it was down to 11.6 volts after half an hour of SOTA operation. Oh, and, I think these batteries were like three bux, suppose to recharge hundreds of times.

I would like to find a 500mah Lipo or similar that was more like 11 or 11.5 volts fully charged for my ATS-3B. The problem is when I start looking at all those hobby batteries I get confused about what charger to use and what connector to use. Anyone know of a web page or tutorial to help straighten me out?
Hams get easily confused as we age! lol

Keith,

For LiPos, you must use a charger that is designed for LiPos. There are bunches of them! You choose one that provides for at least the number of cells in your batteries (11.1 v is 3-cells), and one that allows you to choose a charging current of 1x the mah capacity if the battery (referred to as the "C" rating). The issue with the ATS radios is that you need to keep the supply voltage below 12v. A fully charged 3-cell LiPo will be about 12.4 v. Steve has said this is probably OK if your antenna system has a near 1:1 SWR. Otherwise, you need to stay under 12v. Several means of doing this have been discussed here, including using series diodes and limiting the battery charge to <12v.

On the connector, there are lots of those out there, but you can change them to whatever you want. Just be careful to not short the battery leads while doing it! Most LiPos these days have 2 connectors. One to provide power to a device (your radio), and one for charging. The charging connector allows the charger to charge the cells of the battery independently (only buy a charger that supports this to get the most battery life and to charge safely), and unfortunately there's no standard for these connectors. Most chargers come with adapters that allow charging a variety of battery brands, but this is something you have to check.

Most folks recommend not discharging a LiPo battery below 3.0 volts per cell, under load. It is to this level that the battery capacity is measured.

There are more details, but this covers the big things to worry about.

73,
Randy, KS4L

Hobbypartz seems to be very low on LiPo battery stock right now.
They have a nice 500mAh 11.1V battery I would like to order.
Perhaps they have lowered their stock for New Years tax time?

the 3B has an automatic shut down if current exceeds 800 ma. I don't think you can easily hurt it. I upgraded my finals to BS170's as well. I tune up at nine volts, then operate at 12 volts.

First Fun SOTA for 2013 with MTR/9v battery and loop ...sunny, 40f and ankle deep snow in places ...MTR performed well! Thanks Randy/KS4L!

I just need to convert it to 30m it's currently on 20/40 but for my purposes I prefer 20/30. Maybe when the weather gets ugly we'll find time.

Pics of today's SOTA adventure:

Great photos Steve.
I had my MTR out on New Years Day SOTA too.

Mine is also 40/20 but as I have those bands covered by my ATS4 I'm
thinking of converting mine too.

What I'd actually like is 80/60.

Now for 60m (5Mhz) I can sort out the I/O filters myself, but I don't have
the knowledge on how to reprogram the beast for 5Mhz.

Anyone like to help out with that one?

Pete

10202. NAQP CW is 8 days from today! Please volunteer

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-01-05 03:29:01 UTC
From: Hank Greeb
Topic: 10202 Message: 10202

Hey, owners of rigs designed by Steven Weber, KD1JV. Do you remember the "call for suckers... errrr.... volunteers for team members for the August 2012 North American QSO Party? Yep, six of us suckers... errr... volunteers had a ball during that operation.

Now, time is getting close. A couple months ago, I sent a couple of preliminary messages concerning teams for the January NAQP. This netted 11 "probable" team members. Right now we have 13 volunteers, and I'm looking for for more!

As I said before we could have up to an infinite number of suckers... errr, volunteers to partake in informal "teams". To refresh your memories: The North American QSO Party (NAQP) CW will be in 8 days, Saturday, January 12, starting at 1800Z and ending Sunday, January 13, 0600Z.

Are you interested? The only requirement is that you'd agree to run QRP with whatever kind of rig you prefer to use. This can be any of the rigs designed by KD1JV, or any other rig which can run at 5 watts or less. We already have enough for two teams of 5, but there's no limit to the number of teams we can have.

The "interesting" part of NAQP, for the QRP op, is that it's a "semi-real" contest. It's not all blood and guts, because it is limited to 100 watts for entrants. So, rigs running 5 watts like the AT-Sprint or similar with a pair of '602's or '612's for first mixer and product detectors won't suffer from large signals overwhelming the front end.

If you think you might be available for part or all of the period of 1800Z, 01/12/13 to 0600Z 01/13/13 please let me know. If something comes up at the last minute, we'll understand. At this point the list is of folks who "most likely" will join such an endeavor. Part timers and operators of any ability level are cordially invited. In August, one of our team members made >250 Q's, and one who made 4 Q's (because of family duties which got in the way of participation).

For those who are interested, rules for these QSO Parties are at http://ncjweb.com/naqprules.pdf

Please advise by private e-mail.

72/73 de n8xx Hg
QRP >99.44% of the time

P.S. The QRP ARCI's Pet Rock Celebration this Saturday, 1500 to 1800Z would be a good "warmup" for the NAQP!

Etienne,

You want one of the 3s packs for 11.1V packs. Just about any of the little RC airplane packs seem to work. The "Blue LIPO," or "Zippy Flight Max," are ones that I have heard mentioned as inexpensive and reliable so far.

I did the QRP TTF event last year with a 1000 mAh pack. My actual operating time was around 3-1/2 hours and I did not suffer any power/voltage drop on the pack, and was still in the so called linear range of use. So yes, AA's are overkill/overweight/obese!

Hello again Hanks
and hello to all and happy new year
I read the various ideas regarding battery cells for these units, for my part I use eneloop nimh 2400 or Sanyo green recovery blocks former TRX Portable fire.
when tested with a special charger and several charge and discharge cycles can sort and remove the bad cells, I am building blocks (packs) good quality
10 cells NiMH or 3 cells Li-Ion or Li-Po
Otherwise, I do not have much to write, I do not think I'll build the model immediately 80/40/30/20/17/15 meters because it is no longer possible to find a kit
there may be strong boxes for my ATS3A somewhere?
the ATS3A is good for me, or else may be on ebay in a few days it will be possible to find the latest model 6 bands, it will take a lot I think :) ...
I'd like 10/12/15/17 meters, the low bands interests me less than the higher bands
Sorry for my bad English

Thanks, Jean-Paul:
I, too, have a "grand-daddy" of the AT-Sprint series. Mine is the original, no suffix, 40, 30, 20 meters. It claims to have somewhat higher power consumption at 55 ma on receive. The pins on the modules are smaller than in the later series, and occasionally bend if I don't get them aligned correctly before trying to seat them, but they haven't broken. The unit was built in 2003, and is still very functional.

Any AT-Sprint one can find for sale on this list and on e-Bay should be a very satisfactory rig. The newest rigs have 80/40/30/20/17/15 meters, which offer high versatility. Some of these can run PSK-31 and some other modes with a change in programming of the firmware. All of these features are described in the files section of this Yahoo Group.

If you don't feel up to the task of building, or diagnosis and repair, several people offer building and repair services.

My recommendation, if you are in a hurry, watch for the new MTR kits. If you want maximum versatility, find a built AT-Sprint (any model) or kit for sale here or on e-Bay. You won't go wrong either way.

Hi Fred,

I just recharged my 500maH LiPo battery from today's SOTA outing with Mike. 45 Qs and only 164 maHr. Who knows how accurate those numbers are, but it calculates to only 3.6 maHr/Q. I did not call CQ much and just traded RSTs.

New unofficial, official record !!! FB

SRI missed you guys yesterday; went to breakfast with John and Jim and Phil, then to Jim's house going through various possibilities relating to the MTR build.

Am debating in my mind all sorts of ways to do the deployment ... I am leaning toward something by which the radio is not on the pole, but in my hand so I can access the radio's controls. My thinking is the a short piece of RG174 loss is only two tenths of a DB, and it weighs only one ounce with a connector. And it eliminates the cable for the paddle which is close to the same wight such that it is a wash, but more convenient.

So that has me contemplating all sorts of ways for the thing that is held in the hand which supports the radio, battery, paddle, and log backing ...

Hi Fred,

I just recharged my 500maH LiPo battery from today's SOTA outing with Mike. 45 Qs and only 164 maHr. Who knows how accurate those numbers are, but it calculates to only 3.6 maHr/Q. I did not call CQ much and just traded RSTs.

Hi all,
I'm cleaning out the basement and trying to cull things I am not using.
These are of interest to this group, so I'm posting them here.

KD1JV variable power supply - $20
- PC board from FarCircuits
- all parts required for assembly

Altoids 20W PA by JN1GLB- $75
- completed amp built by Vojtěch Bubník
- includes filter boards for 15m, 17m, 20m, 30m, 40m, and 80m

Please reply off list with your mailing address so that I may calculate shipping costs. I prefer payment by USPS Money Order (ships upon receipt of money) or personal check (held for 10 days after receipt in order to clear before shipping).

Thanks.

NAQCC Sprint Wednesday night!

Our January sprint is this coming Wednesday evening local time (January 16, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Thursday January 17, 0130-0330Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201301.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prizes page on our website.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6400+ members in: All 50 States - 9 VE Provinces - 90 Countries. Make it one of your New Year's resolutions and sign up on the NAQCC website today (http://naqcc.info/) to receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

10218. MTR on 60 Metres (5 Mhz)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-01-16 19:12:06 UTC
From: paradoxpete.pdm@...
Topic: 10218 Message: 10218

A group member has kindly cut me the code to place my MTR on 5Mhz.
I received my TI Launchpad today, so will be in a position to flash it in the next few days.

I've been looking at the I/O filters and trying to calculate what is needed for the band change.
I've come up with some values for components but would be interested if anyone has a quick way to model the filters before I heat the soldering iron up.
The rig isn't the ideal test bed, so if someone has values that work at 5Mhz I'd be grateful to compare notes.

Regards

Pete

From: Steven Weber
Topic: 10218 Message: 10219

These are the values I came up with to put the Tribander on 60M, but are for producing 5 watts at 13.8V supply.

The PA side inductor value will likely need to be changed and the number of turns redone for a T30-2 core:

PA > 680p (20 turns on T37-2) 1200 p (20 turns T37-2 || 150 p) 680 p > ANT

As far as the receiver side I used 22 ufd inductors with 70 pfd trimmers. Since the trimmers on the MTR are only 30 p, pad approperately.

Since I suspect the code would be of interest to others please ask the author to post it to the ATSprint group files section. I suspect parts of it are applicable to other ATS rigs too.

Steve,
Many thanks.
I'll play around with those values.
I take it you mean 22uH inductors, not 22ufd!

Any news on a second run of MTRs.
It would probably be just as easy for me to build a new one for 80/60
rather than modify my 40/20 one!

Hello to all
I am a beginner in how to modify the program to change the band on ATS 3A for example, I have a ATS3A.
Even if he can not make a lot of W, for example, replace the 80 m band claiming too long antenna cell by a shorter band.
I would have probably build a new small printed circuit board and I have no picture of the circuit to the positive burn another card.
And even if I wanted to make another just for testing, is that someone with that?
Regards to all for this new year 2013

Maybe Steve could let Hendrick's QRP sell the kit? The 3B would even suffice ;)

Way off topic, but I just noticed in the bid history for this that all the bids have exactly the same date/time. Is this some kind of funny-business?

They don't have the same date and time ... close ... what you see is an ignorant bidder who doesn't understand how ebay works, and he bid more than once in rapid succession of course being outbid automatically by a higher bid. I am amazed how many people still don't understand bidding on ebay!

No, he just doesn't understand that you bid once, your highest offer, and forget it. He bid over and over, until reaching his highest bid, and probably thought somebody was watching him and bid against him. not.

My Android phone was also showing the same time for bids, obviously a bug as you say.

Gosh I could just do with a few ATS4s to sell, I would be able to buy myself a KX3 then! I guess 3 would just about do it!

It makes me wonder how much an MTR would fetch. I don't think I'll ever part with #131 though, I love that rig so much!

Without even looking at eBay, I can just see the "bidding wars" that happen, I've encountered the same problem with a few items, too. The only people I really buy from are "buy now", and a firm price. Too many have been time wasting scams, one overseas chap actually took the price of a vintage stereo receiver beyond belief on price, so I quit wasting time.
When you look at the number of bidders, the time and price, you know a scam is being put on the whole thing.

Makes me wonder if "ham radio" items are even bought by ham radio licensees, or just traders who make enough to pay the bills every month.

Time to go look up my kits, decide on a time factor.

10245. Ultralight 20m EFHW Antenna Idea

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-01-23 04:57:43 UTC
From: steve_wg0at
Topic: 10245 Message: 10245

Still dialing in my SOTAlite rig for upcoming season. Still need to convert my purchased MTR 20/40 to a 20/30 but meanwhile I shrunk this impedance matching network idea (link below) to fit into a plastic floss case. Haven't had a chance to field test it yet but my analyzer sure likes it! Hope it actually plays well on an upcoming SOTA this Friday! Thinking of adding a clip on section for 30m once I get my MTR converted to 30m.

Hi Steve,

Minor correction to your schematic. The impedance transformation is 1:81 because it's the square of the 9:1 turns ratio, or 50:4050 ohms. EFHWs have a very high impedance.

Nice job of construction and you always have a good signal in NC from the summits.

73, Bill

Sniping is usually used in the last few seconds. Probably someone has set their max price and each bid up is outbid until the max price is reached.

Thanks Bill! Yep, Disregard the pics and drawing for the 9:1!

It's only the last 4-pics in that set that pertain to my post here. My bad. That set up was for KX3 with it's superb ATU where I was just trying to reduce the high impedance of the EF to ~500ohms or something KX3's ATU could easily handle!

But for my MTR I wanted 50ohms of course and built a mono-band 20m EFHW 'fixed' tuner ...it does drop the 4k to 50ohms as seen by the analyzer pics! Not my design but just my reconfiguring to fit it into the smaller/lighter floss case. 2-different setups entirely ...Sorry for any confusion.

Cheers, Steve wGOAT

This should fix it! I pull those pics into a separate slide set named 'MTR 20m EFHW'
http://www.flickr.com/photos/goathiker/sets/72157632590116589/show/

And yes the wire is Teflon I find the goats don't pefer it as much as the plastic or rubber coated wire. Nor do they like the pepper spray coated coax ...when remember to that. ;-)

10253. Re: Ultralight 20m EFHW Antenna Idea

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-01-23 15:56:54 UTC
From: Reed White
Topic: 10245 Message: 10253

I have used (and still use) an end-fed Zepp technique similar to the posted design, and it works well. Some minor differences:

(1) I switched the location of the inductor and capacitor to reduce the possibility that a static charge or other voltage getting to the antenna would damage the final transistor. Maybe there is a better reason for doing it the way you did it -- if so, it wold be interesting to know.

(2) I used an air-core inductor, which I believe might have slightly lower losses. However, the proper toroid is probably good enough, and it certainly saves space.

Thanks for posting your detailed design info.

It's taken a bit longer to get the case nailed down then expected. The tenative shipping date (from the factory) is now March 15th.

At 4.4 oz, the case is also a bit heavier then I expected, mostly due to using steel instead of aluminum for the top piece. But this makes for one really rugged cabinet!

I'll have 100 cases available at $20 for those who want the new offical, bullet proof box for thier existing MTR.

I'll start accepting orders around the end of Febuary, to allow time for your check or MO to arrive and be able to ship the kit just as soon as the cabinets arrive from Ten-Tec.

That's right check or MO, I will no longer accept payment via paypal except for DX orders. We'll figure out the details of how that will work later.

Reed ...I was just repackaging a given design hadn't given any thought about the static issue? Your's might be the wiser choice? And I went with toroid design simply cause it saves space and was a little easier to package for trail use. wGOAT

Forgot to mention my efforts yesterday were almost for not when unpacked my MTR I noticed one of the slide switches was busted clean off! And the last time I use the rig was 40m! I was aiming to get on 20m ...uh-oh? Forgot a knife so car keys to the rescue. Using the point of a key I was able to slide the switch to 20m position ..Whew!

And NO Rooster didn't step on my MTR! I think something got sideways in my pack and broke it off??

Does anyone have an extra slide switch in their spare parts? Thanks, Steve wGOAT

We have a volunteer.. I got to checking.. and sure enough.. Rick NK9G has a partner.. so there will be two FOXii running
and slinking around in the 80 acre woods.. somewhere between the two trees marked 3550 and 3570...
hiding and slip sliding around... handing out all the pelts possible..

so we are on ...

Sorry for the late announcement.. time gets past so fast... it's just a good thing I checked...
Good luck to each of you, and may the Props be Ever in OUR Favor!!!

oh.. the other volunteer?? I checked... it's me.

Good Hunting! Find me if you can.. I've got a new temp antenna up.. this time in 50 mph wind... but the temp is 53F..
So.. maybe it will be a 50/50 antenna?

Have a great day,

Hi Steve,

Have you heard of the LA1KHA PP3/MN1604 Challenge ..? Kjell set out a challenge to see how many QSO's and DXCC's he could manage using
a single PP3/MN1604 9V battery powering his Rockmite/other low power rig from SOTA summits.

I enclose a link.... looks like fun.
http://www.sotawatch.org/reflector.php?topic=5053#foot

Well done with packaging the UNUN in the floss case.

Good luck in Barbados. Will listen out for you.

The rig will work down to at least 5.5 V. The receiver will likely stay working down to about 4.5 volts, not sure if the PA keying will still work that low.

I'm not sure when, if ever, I'll go back to that design. It wasn't panning out nearly as well as I had hoped and then I got side tracked by something else. Hint: look for something new from QRPKITS in a few weeks...

KD1JV

Does the progress with the MTR mean that you'll be getting back to your earlier project of a 160/80 meter rig?

I'm waiting on pinzandneedles for that one. I'd LOVE to be able to run with one of your rigs in the CQ 160 or ARRL 160 contest!

Hi Steve,

I heard about this years BITC trip on one of the ham podcasts I listen to. I hope the trip goes well and you shoot lots of video to share with us :-)

I started having a go at the PP3 challenge to learn and improve operating in CW. I also used the challenge to hone my home brewing skills.

I had lots of fun doing the challenge last winter, it certainly helped a lot to get me going with CW for SOTA.

The trouble is that PP3s last too long! I can't commit to enough summit outings to use up the battery!

In May I built my MTR and now it has replaced the RockMites in my pack. The MTR is such a cool radio!

I guess things might be a bit different in the US, but I found 40m is best for sheer numbers of contacts. I suffered lots of QSB on 30m. With my 20m challenge rig I worked N1EU, this worked out at 36,393 miles per watt! I have the certificate on my wall .

All the best for your trip, I'll try and keep an ear out for you.

73, Colin M0CGH (patiently waiting to order a new MTR!)

Johnny,
I don't believe the MTR can go to 15M (21 MHz), as the DDS is clocked at 40 MHz. As a rule, one cannot produce a (clean) signal at more than a little below one-half the clock frequency.

Steve,

I recently got my MTR running, and I noticed that the switches look vulnerable - thanks for telling us, because now we can be more careful in handling the rig.

I'm thinking of cutting off about half of the switch actuator stubs...but I haven't done it yet. They don't need to be so high, since they're not meant to be moved except for changing bands. I think sharp cutters and a bit of sandpaper would do the job OK without messing up the rig.

Unless Steve Weber tells us the part number, it might be possible to source these switches at Digikey or Mouser. They have a lot of slide switches, so it's not trivial.

10291. Re: MTR Going on 3rd SOTA w/9vdc Battery

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-01-27 17:23:09 UTC
From: radio_kx0r
Topic: 10277 Message: 10291

All,

The performance of these well-engineered rigs on low voltage is impressive - this is why a used 9V battery can deliver so many Q's.

However, there is another side to this - especially for portable use -why knock the signal down several db from what it could be? Why not run 4 or 5W with an efficient battery, along with a good antenna, and let everyone have an easier time copying?

While at times even a few milliwatts will create a QSO, most of the time with our low-to-moderate solar activity, and compromise portable antennas, even 5 watts is down in the noise as the QSB periodically pulls the signal down. Two or three db often is the difference between rough copy - or no copy - and OK copy. When you're 20 or 30 db above the noise floor, 2 or 3 db is nothing. When you're right in the noise, 2 or 3 db is huge!

Whenever I go portable, I use a 3-cell lithium-ion battery and run 5W out from my ATS/MTR rigs. I think that the other guys deserve as good a signal as I can reasonably create.

When I copy other QRP stations, many would benefit from another 2 or 3 db. Honestly, signals are often marginal.

I think this "9V battery thing" has gone too far. Just because the ATS rigs will work OK with them doesn't make up for their high cost and their inability to be recharged. The hobby parts stores are selling economical, high-performance lithium polymer and lithium ion batteries, some of them very small and light; with a little knowledge and appropriate caution, for a few dollars, you can have a really good power source and a signal with more presence through the QSB! With a few ounces you can operate over a three-day weekend or whatever.

The point of QRP is not to be weak, or weaker, but to communicate more or better with less. Good QRP technology - like the ATS rigs - enables us to operate comfortably from the wilderness, or do SOTA peaks, or have interesting experiences or events from places we otherwise would have never operated radios from.

The whole thing is more fun if signals are Q5...

Steve,

>>> Makes me want to take the challenge here in NA maybe some one has?

I'm not aware that anyone from NA has as yet .... I was hoping you'd possibly do something with the idea over there .... since you
were already counting QSO's made from a 9v battery.
Might need a little tweaking and include states along with DXCC's since America is bigger than Europe.
Saying that ....I did manage a QSO with N1EU with my Rockmite.

I'm now waiting for my chance to get a MTR .....

Good luck with the packing :-)

...what about 17m? 18 MHz would be something more than a little below one-half of the clock frequency. Yes, something less more than 14MHz would, but ... someone give it a try? It would be GREAT for me to have an ALL-WARC MTR (30m & 17m), as I am mostly active on weekends and try to keep clear from contests as much as I can. Here in old EU with maybe some 75 different countries on a place not much bigger than your W5, you will find almost each weekend a country having it's yearly most important DX contest. Digging with QRP around those big guns is not much fun for me, so this is why I try to stick with the WARC bands.

I don't believe thee is any technical reason you could not do 30M/17M on a MTR. All you have to do is determine the 17M filter components, and modify the firmware appropriately.

Hi NX0R,

I think you've missed the point.

The point of ham radio is trying new things and pushing limits. The MTR is a superbly efficient piece of kit, why is it so bad to test it's abilities to the limit and discover just how far you can go?

The fun is in doing new things and finding new ways to do things.

We have a saying witin SOTA circles - 'Activator is King', sure it's great to know that you can take a sturdy battery and pump out 5 watts all day long, but it can sometimes get a bit dull.

It's quite amazing just how far a few milliwatts will go from a good location, signal strength is not the only measure of a good QSO.

> However, there is another side to this - especially for portable use -why knock the signal down several db from what it could be? Why not run 4 or 5W with an efficient battery, along with a good antenna, and let everyone have an easier time copying?
>
> While at times even a few milliwatts will create a QSO, most of the time with our low-to-moderate solar activity, and compromise portable antennas, even 5 watts is down in the noise as the QSB periodically pulls the signal down. Two or three db often is the difference between rough copy - or no copy - and OK copy. When you're 20 or 30 db above the noise floor, 2 or 3 db is nothing. When you're right in the noise, 2 or 3 db is huge!
>
> Whenever I go portable, I use a 3-cell lithium-ion battery and run 5W out from my ATS/MTR rigs. I think that the other guys deserve as good a signal as I can reasonably create.
>
> When I copy other QRP stations, many would benefit from another 2 or 3 db. Honestly, signals are often marginal.
>
> I think this "9V battery thing" has gone too far. Just because the ATS rigs will work OK with them doesn't make up for their high cost and their inability to be recharged. The hobby parts stores are selling economical, high-performance lithium polymer and lithium ion batteries, some of them very small and light; with a little knowledge and appropriate

caution, for a few dollars, you can have a really good power source and a signal with more presence through the QSB! With a few ounces you can operate over a three-day weekend or whatever.
>
> The point of QRP is not to be weak, or weaker, but to communicate more or better with less. Good QRP technology - like the ATS rigs - enables us to operate comfortably from the wilderness, or do SOTA peaks, or have interesting experiences or events from places we otherwise would have never operated radios from.

You'd have to change the reference clock and DDS filter too. The stock rig uses a 40 MHz clock to keep the current down. There is a bit of jump in the current draw when going to a 50 or 60 MHz clock - on the order of 10 ma.

A 40 MHz clock is a little marginal already for 14 MHz, but is close enough to the 3X rule of thumb. 18 MHz would be not be acceptable. The DDS filter starts to roll off at 14 MHz.

Maybe. It has crossed my mind. But that means I'll have to figure out a filter too. Since that band is so limited, being restricted to one of 5 channels, I kinda doubt there's be enough interest to warrent supplying the parts for the filter (which takes extra time and money). Unless the band works differently in the EU and your not restircted to channels? If that's the case, I'd have to support both schemes. Errr, getting complicated...

Any chance the next run will include 5Mhz as a build option, before I take my soldering iron to my trusty 40/20 one?

With a 40 MHz clock, trying to generate 18.1 MHz would produce a strong
spur at 21.9 MHz, along with other junk. It would be tough to filter out.

The 5MHz allocation in the UK has just been increased a lot. Also several other European countries now have allocations around 5MHz with more in the process of being allowed.

Several of the countries now have non-channelised allocations (incl the UK) so it's probably best just to treat it as another band with upper and lower limits.

Perhaps if you made it really obvious in the software how to set/change the limits then people could reprogram their rigs themselves. Or depending how much work it is, make it possible for the user to store the limits using a special command.

Thanks Steve,
I appreciate the 5Mhz audience may be a bit limited.
As I said before Dave,, VK2DDJ has already provided me the code for operation for 5.258Mhz through to 5.406Mhz, which encompasses all our UK allocations.
I haven't got round to flashing my MTR yet due to lack of time, but hope to do so in the next few days and hopefully get the filters sorted too.
Once done, I'll have all bands from 80 to 15 split between the MTR and ATS4
:-)

Finally finishing up my kit. I used the fixed inductors in place of the input toroids. I do get a clear peak with the receiver input adjustment cap, but the receiver is very insensitive. My 50uV signal from my Elecraft SG-2 puts only 3 bars on the ATS-4's S meter. All other bands have normal reception. Maybe go back to the toroidal input for 20m? Any other suggestions?

Okay, I was afraid of that. In the US, we have to operate on 5 specific channels on exactly the center frequency. The only practical way to do that is to have those frequencies pre-programmed into the rig. I've got some time between now and when the next batch is ready, so maybe I'll look into adding these options.

I've been trying, in vain, to get my MTR to talk to my Launchpad.
When attempting a download I get hardware initialising
and then get an error
"could not find device or device not supported"
If I add the processor to the Launchpad that came with the kit, it identifies that OK and even warns that it is not the correct device, so the UART software appears to be running OK.
I've gone as far as checking the Test and RST signals on the MTR board with a scope (although not on the actual MSP430 as it's so fine a pitch) and they look good.

Any ideas.

Steve,
Yes I do have power connected.
I've played a little more today.

As soon as I start the download/Debug, the IAR software flashes up it's
initialising hardware dialogue.

Immediately on the MTR, the decimal point, power on indicator, goes out
and a few seconds later comes back on with the band anounciation and
display, e.g. ....- and 4 on the LED.
At this time I get the "could not find device error message".

I notice on the scope that the TEST signal is sitting low and goes high
with a data burst.
The RST signal is permanently high and blips low a couple of times during
the sequence.
I've now checked and these signals are measured on the processor pins
directly.

IAR reports the following:

Thu Jan 31, 2013 18:03:12: Using license: Standalone license - IAR Embedded
Workbench for Texas Instruments MSP430, 4K KickStart Edition 5.51
Thu Jan 31, 2013 18:03:14: Firmware version 30394216
Thu Jan 31, 2013 18:03:14: Interface dll version 2.4.9.1
Thu Jan 31, 2013 18:03:22: Fatal error: Could not find device (or device
not supported) Session aborted!

I'm assuming therefore something is wrong in the configuration of the
workbench files.
I'm trying to use MTR.eww and it shows up with the following components in
the Output tree:
MTR.d43
dl430fn.r43
lnk430F2132.xcl
MTR_3.r43

10317. Use of C-Size Alkaline cells for Power Source?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-02 15:05:39 UTC
From: Hank Greeb
Topic: 10317 Message: 10317

I'm wondering about the use of C-Size alkaline cells for a power source for my AT-Sprint.

My question all started when I bought 6 C cells for a backup battery for a boom box which needs power to maintain its memories when we move it from place to place. I screwed up - the thing needs D cells. Of course, I had destroyed the package in which the C-Cells came, so I'm stuck with them.

Rat Shack sells a holder for 2 C cells. Mouser sells several version of holders for6 cells.

But, Before I jump in with all four feet flailing.....

Has anyone used C-Cells for powering a QRP rig? The characteristics put out by Duracell, Energizer,etc. would seem to indicate that C-cells have considerable more capacity than AA cells. Does that translate into significantly longer life during actual use?

I'm not particularly concerned about weight. I have an 8 pack of NiMH cells which I use when I'm hiking.

Comments?

Yes. The rig doesn't care as long as the voltage is correct. Brand new alkalines are typically 1.6V so 6 gives 9.6V max and will last a LONG time in an ATS rig (8000mAh vs 500mAh so 16 times longer).

OK folks, thanks for all the assistance.
I started everything in IAR from afresh.
New Directory and new files using the updated MTR_3.s43

Plugged it all up , downloaded and debugged and set for FET Debugger.
I'm afraid I'm going to have to admit defeat on this one.
It still will not recognise the device.

I can plug the supplied MPUs that came with the Launchpad kit into the
header on the Launchpad and can merrily download the code to those no
problem.

I've reinstalled the UART drivers, updated IAR and tried it on a different
machine.
I've remade all the Spy Bi wire connections and monitored signals on the
MPU.
It will not recognise the MSP430f2132 - period!

It looks like I'm destined to stay on 40/20!

This has been an interesting project but I've spent way too many hours now
and not progressed at all :-)

I haven't had so much fun since I last worked on PDP11s!

Hi Hank -

Yes, I will agree that they will work - for a very long time. Some folks have been working those rigs at about 5 mAH per QSO (see msg 10188) - so maybe you could get 1600 QSO out of a set of six C cells - a whole summer's worth of use perhaps??

From: jgaffke
Topic: 10308 Message: 10321

Weird. MTR works, SpyByWire talks to the launchpad device,
TST and RST are toggling, but won't connect to your MSP430.
Maybe TST and/or RST into your MSP430 got blown somehow?
Best bet might be to have somebody burn an MSP430 for you,
and you then solder it into place. Should give you your
new code. And maybe fix your SpyBywire connection.

I suspect you could buy a fresh MSP430f2132 from Farnell and blow it yourself by soldering wires to it for VCC, GND, TST, and RST. Bend the VCC pin a bit out of plane (not right at the IC body, would weaken the pin) to avoid shorts. TST and RST might work even if shorted to an adjacent pin. Practice first with a DIP from the SpyByWire kit. Or spend all that time instead enjoying operation on 20 and 40.

Pete,

How long are the jumpers your using between the boards? Anything longer then about 6" can cause problems. There was a note about that somewhere in the TI documentation.

Good point about the wire length. And if blowing a raw chip with SpyByWires soldered directly to the pins per my previous suggestion, might want a 0.1uF cap between VCC and GND near the chip as well.

The jumpers are about 4" long so don't think that is the problem.

I can only assume that
a. the MPU is faulty.
b. I have a bad connection on the TEST Pin
c. it just doesn't like me!

I've acquired a new chip so I'll try and flash it by tacking the wires
directly to the launchpad.
If that works I'll consider replacing the current MPU or maybe wait and see
if I can get a new MTR :-)

Just to say, it's working!
The problem was on the Launchpad board all the time!
The rig is now happily running on 5mhz.

I just need to change a few LC components and hopefully we'll b edd good to
go.

Thanks for all the help. I've learnt a lot in the process!

Hi Peter,

Congratulations!
Sorry it was a hardware fault. Never easy to find out when you think "industrially made" hardware should be reliable and working as specified...

Recently I knocked my head against a wall with parts being on the edges of specifications. With prototypes and samples everything was going smoothly and I had margins.
Preparation a "production run" I had a lot of parts with two groups on both edges of the specs, and some of my MCUs (MSP430G2553) were also having different behavior that the one I had in hands before...

Enjoy 5MHz (as I don't even dream about it in Viêt-Nam)!

73,
Yan.

10332. *FOR SALE* KD1JV Nor'Easter table-top RX

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-08 15:29:37 UTC
From: John Shadle
Topic: 10332 Message: 10332

This may be poor timing on my part, especially with respect to the storm that is about to hit the Northeast...but I would like to offer up this partially (over 80%) built kit.

KD1JV produced two Nor'Easter RX kits. This is the first version, and it is through hole (not SMT, like the more ubiquitous version). According to Steve KD1JV, there were "about 50" of these kits produced.

The kit is more than 80% complete. I will include a printed out manual for you to complete it. You should be able to provide an enclosure for the kit (Steve suggests wood, but any enclosure would do).

Here's the description from the manual:
The receiver tunes from 200 KHz to 19.000 MHz. There are eight preprogrammed frequencies available for quick recall and 21 user programmable station frequency memories. The receiver powers up at 7.000 MHz with a 5 KHz tuning rate. To conserve power, the display blanks about a minute after it comes on. (Display blanking can be disabled by grounding pin 12 of the cpu, U8) A 10 to 20 foot long antenna is recommended for best reception, especially if MW reception is desired.
The tuning encoder, which has a built-in push button, controls the operation of the receiver. Note that the receiver tunes with every other “click” of the encoder. The push button is used to wake up the display if it has blanked, selects the tuning rate, enters the pre-programmed frequency bands and user programmable memory functions. Push and release the push button, or turn the tuning knob to wake up the display if it is blanked. Push and release the push button to step through the frequency steps. The selected tuning decade digit will blank for a moment. Tuning rates of 5, 10 and 100 KHz maybe selected. Push and hold the push button to enter the other modes. Release the button when the desired function is shown on the display.

Asking $50 shipped to the US. PayPal is fine, or check or money order.

Thanks!

I din't realize the run on the "tabletop" version was that small. I have one of each of these, and they both work vey well. Like many (most) of my projects, they still have not made it into that "perfect" enclosure yet. Someday...

MTR progress update
On Wed, Jan 23, 2013 at 4:59 PM, Steven <steve.kd1jv@...> wrote:
It's taken a bit longer to get the case nailed down then expected. The
tenative shipping date (from the factory) is now March 15th.

At 4.4 oz, the case is also a bit heavier then I expected, mostly due to
using steel instead of aluminum for the top piece. But this makes for one
really rugged cabinet!

I'll have 100 cases available at $20 for those who want the new offical,
bullet proof box for thier existing MTR.

I'll start accepting orders around the end of Febuary, to allow time for
your check or MO to arrive and be able to ship the kit just as soon as the
cabinets arrive from Ten-Tec.

That's right check or MO, I will no longer accept payment via paypal except
for DX orders. We'll figure out the details of how that will work later.

72, Steve KD1JV

10339. NAQCC Sprint Tuesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-09 02:00:22 UTC
From: NAQCC
Topic: 2905 Message: 10339

NAQCC Sprint Tuesday night!

Our February sprint is this coming Tuesday evening local time (February 12, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Wednesday February 13, 0130-0330Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201302.html

There you will find all the details as to time, frequencies and other important information.

SPECIAL NOTE: This is the 100th regular NAQCC sprint, and to celebrate, the NAQCC is offering some very special prizes to 13 MEMBERS who participate and report their results. Prizes will be awarded via a computer drawing. The prizes are being kept a secret until the drawing, but the first prize will be an item valued at over $150.00. For details check the sprint rules.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6460+ members in: All 50 States - 9 VE Provinces - 92 Countries. Sign up on the NAQCC website today (http://naqcc.info/) to receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

Thanks guys, I had read about the new cases but I thought that they were to be sent out to be retrofitted to existing rigs. Now I know that the shippping has been held up until the cases come through.

I'll keep checking to see when Steve pulls the trigger.

10341. ATS4 External Controller

Yahoo group: AT_Sprint (2012 — 2013)

From: katsumi.seto
Topic: 10341 Message: 10341

For easier ATS4 operation, I built an ATS4 Controller with touch paddle as shown blow. Though I call it "Controller", it is nothing but simple directional tact switch box. I used ALPS SKQUAAA010 tact switch which has 4 contacts in one package, one for each direction. It is much easier to move aound the CW band than separate up and down tact swith.

10342. Changing Finals and Driver in ATS-3A

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-11 04:55:07 UTC
From: radio_kx0r
Topic: 10342 Message: 10342

Today I did an experiment that may be of interest to a few of you. I took my ATS-3A to the test bench, connected it regulated power, and recorded its power out, current consumption, and harmonic levels on the 20M band. This rig has served well, and there was nothing wrong with it.
14.06 MHz 5.1W 11.95V 800mA 2F -65db 3F -42 db It was more efficient on the lower bands, with similar numbers except for current, which falls somewhat with frequency.
Then I took the board out of the altoids box, and removed the three 2N7000 final mosfets. These were the original finals. I replaced them with BS170 mosfets made by ON Semiconductor. They now have the flat sides up instead of down. I did nothing special to them - no copper heatsink as I used in my ATS-3B when I replaced those finals some time ago (one of the 2N7000's did short in that rig).
Then I unsoldered the 74HC02 driver IC. This was harder than I expected. I tried to lift the legs with a steel wire, but the IC package partly disintegrated. I ended up cutting off some legs and removing the chip in bits. Fortunately the PCB was undamaged! I cleaned the pads and soldered in a new ON Semiconductor 74AC02. This is the driver used in the ATS-3B, ATS-4's, and MTR.
After re-installing the pcb in the Altoids box, and after a quick check with a current-limited supply, I tested the modified transmitter. To my great relief the rig behaved almost exactly as before!
I did no re-adjustments to the filter boards, the toroids, etc.
14.06 MHz 5.2W 11.94V 770mA 2F -67 db 3F -44 db 4F -54 db 7F ~98 MHz -51 db ~8 MHz -49 db ~98 10.11 MHz 5.3W 11.95V 690mA 2F -63 db 3F -43 db 4F -58 db 9F ~98 MHz -54 db close-in spurs -52 db7.03 MHz 5.1W 11.95V 660mA 2F -56 db 3F -43 db 4F -59 db some other stuff -52 db close-in -56 db3.56 MHz 5.3W 11.96V 610mA 2F -53 db 3F -44 db 4F -54 db 13F (~46 MHz) -52 db no close-in spurs seen
My rig has a modified key-shaping circuit, and the keying wave is still nice (unchanged).
The actual drain voltage is lower than the voltages above, because of the drops in the test leads used to power the rig, the schottky diode, the drop in the keying circuit, and the polyswitch I added for protection. So the efficiency of the PA is really good, and it improved a bit with the mods.
No complaints here!
So is it worth replacing the finals? Maybe not, until you have something happen to them - which may be never - then replace with the BS170's - just remember that the pinouts are reversed!
Is it worth replacing the driver? Probably not, unless you're better at surface mount removal than I am. Since I did the whole job in one short session, I made no set of measurements to see if changing from the

74HC02 to the 74AC02 made any difference. I also didn't examine the gate and drain waveforms to see if there was any real change.
So that's the story today...continuous improvement, good luck, no miracles!

Sorry for the long delay in replying.
To say that the problem was with the Launchpad was probably not 100% correct. It was my use of the Launchpad that was the problem :-)

Anyway let's start at the beginning for a quick lessons learnt as it may help some others.

I started by loading the new code into IAR Workbench (here on known as IAR).
I added three jumpers from the from the LaunchPad (LP) to a three pin header plug which fits into the MTR.
I soldered the jumpers to the header pins that connect the emulator to expansion on the LP.
Everything looked good, and I ran the download.
It failed with and error message "communications error - no port available".
After much head scratching I looked in the device manager on my PC (Windoze XP SP3) and find a ? beside the MSP430 Application UART. The driver had not loaded when I installed IAR.

After lots more head scratching I finally got the driver to load.
If you have this problem to save you time you need to search for the driver manually during the process.
It will be found in - Program Files\IAR Systems Embedded Workbench 6.4\430\drivers\TIUSBFET\eZ430-UART

Once installed, I tried a download again.
It worked - or appeared to. When I checked the MTR it was exactly as before.

Back to the drawing board and at this time one of the jumpers broke off the jumper.
After reading the alternate Instructions, I found that IAR was in "simulation mode" not download mode.
I went in and changed the properties for TIUSBFET on IAR.

I decided to fix the broken jumper by just plugging it into the expansion DIP socket, after all the same signal is there, I know, I'd scoped it

already.

You know the story already. It wouldn't work.

More research and I find that lead length is critical, so I cut all the jumpers down to 4" and to save me resoldering, just plug them directly into the DIP header.

Still no go!
It was at this point that I was tempted to throw in the towel.
I decided however I wouldn't be defeated.
I went back to the original setup and connected the jumper wires onto the jumpers between Emulator and Expansion.

Lo and behold, I tried again and it downloaded first time!

I moved the same wires back to the DIP header - it fails!

So the answer is that it doesn't like taking a feed off the DIP header. I expect the extra capacitance between the tracks makes a difference.

After so much playing I wasn't done yet.

To make things as simple as possible with the rest of the modification, I decided to use my 40m position for 5 Mhz and keep 20 as it is. This meant modifying the code again. After a quick look I saw how simple this is, so reworked the code and flashed the MTR again. Naturally it worked first go (I'm getting good at this!).

Happy that the code was working I set about changing the filters.
Luckily I had a few spare components left over from the ATS4 and MTR for unused bands.
I would end up using these!

In the end it looks like this:
In the RX section I used 39 uH inductors. These peak up OK with the 30pf trimmers already installed.

In the TX I used the following:
L12 18 T
L13 20 T
C47/C57 680pF
C66 - 115pF
C52 - 1240pF

Now, as I said, I used the components left over form previous builds, mostly the 80M components from the ATS4.
C66 is the original 40M 68pF SMD capacitor with a spare 47pF piggy backed on top!
C52 is the original 40M 680pF cap with a spare 560pF again in parallel.

I started with L12 at 20T and L13 with 23T but ended up with the figures above.

That gave 4 Watts O/p into a dummy load with a 10.7V supply.

I boxed it all back up last night.
I took it with me today on a SOTA activation to give it a whirl.
Unfortunately my 40M antenna didn't want to play ball and I couldn't get a good match with my tuner.
Regardless, I managed 4 QSO's all giving me 579, so it's obviously working OK and the receiver worked a treat.

I'll cut a new antenna in the morning and if I have time give it another spin.

So that's it folks. I have a 20/60 working MTR.
Thanks to everyone who has helped out and shout if you need any further info.

Today's outing, if your interested!

Pete, great to hear you got it working! Thanks for the update.
I'd guess there's something more going on here than trace capacitance.
Maybe somebody with a healthy jig could try adding caps till it fails.

The Launchpad software was apparently written to give a nice demo,
not to help debug the many problems that always seem to pop up.
The error messages are pretty generic. I'd be a lot happier with
Launchpad if TI could spare a man-week to build a simple but robust
binary loader.

I decided to fix the broken jumper by just plugging it into the expansion DIP socket, after all the same signal is there, I know, I'd scoped it already.

If you removed the jumper blocks on the header pins, then the signal is no longer connected to the dip socket. Then you need to connect the jumpers to the "emulator" side of the pins.

Hello George:
Just a quick FYI on removing the chips, order you some chip quick. It's a solder that has a low melting point, so you have more time to just pick the chip up before the solder sets!
I had tried two irons on a cap, and since one was grounded and one wasn't I got a little bite out of the deal!! Oh we'll not to try that again!

Hi Lew,
Probably it works. At the beginning, I was planning to use a Nintendo game controller but I could not find the junk. Only concern is that most of those game cross pads use conductive silicon rubber as contact which may have some resistance. The microprocessor of ATS4 monitors the voltage applied to pin#10 to determine which button is pressed. If there is some contact resistance, it may detect them wrongly. The contact resistance may be remarkable especially with "UP" button which require 0 or near zero resistance. Anyway, you may try and find it out.□@de ja7qil/katsu

Dale;

Anyone who's too young to know that Heathkit made the HG series of gear doesn't need to be able to buy one, anyhow! I have another, newer brand of signal generator that I have yet to use, it's waiting for me to put a signal into something to test!

My next trick is to remove the Apple software of QuickTime (for the Amazon MP3 downloads, supposedly, and get rid of "funmoods" browser that clogs up my screen with pop-up ads, nearly made me pull my hair out until I found the two "applications" that gave me all that pestilence, then I reinstalled Firefox - and everything cleared up, even got Google back!
Gad, it's gonna be a relief to have the shack totally cleaned up, the computers controlling my Kachina ham rigs as well as decoding PSK31, will even have one 'puter NOT connected to the Internet, and thus not having any problems with bug and virus "machine destroyers".

If I lived exclusively in Yorktown, TX, and had all my fine gear set up there, I'd never have much of anything to do with email and the Internet at all. That idea was ongoing "many moons ago", then too many events and problems came up from out of nowhere, so I need to learn how to talk on SSB again, hook up my straight keys and paddles to the different rigs, go back to ham radio!

Hello Gil
And hello to all
I confess that I am a bit like you, I am very annoyed by all those things that come with modern navigation software or downloads,

I return to simpler versions like XP or even Linux soon, as there often "bad gifts" unwanted and too many updates not useful, and indeed,

a PC is not connected to Internet radio is required.
Many options are useful things can young new users, but not to us the ham radio.

I've a nice HG-102 sig gen for sale, it works, and is what you'd expect. No.. not museum quality.. but then these are working units. It is priced at $75 shipped to your door. (US only) Outside US you get to pay the shipping.Photos available. I dont have a manual, but they are available online. email direct please.

10355. Re: [AT_Sprint] Re: ATS4 External Controller

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-12 07:03:01 UTC
From: Roger Critchlow
Topic: 10341 Message: 10355

I bought a baggie of these:

http://dx.com/p/mt-008a-multi-function-switches-10-piece-pack-122745

a while ago, thinking they were NSEW+Push joysticks, probably because the description said that when I ordered. I just soldered one onto a SMD prototype board and checked the continuity, and that is exactly what they are. One pad is common, and the other five short to common as the stick is manipulated, adjacent directions can short at the same time. Less than an ohm contact resistance.

Searching "diy" on Dealextreme brings up a lot of other stuff,

Nothing wrong with Randy/KS4L's old label but since I was making mods to his old MTR now mine I decided to make a new label. It's in the MTR folder as DIGcamoLABEL.jpg

Cheers, Steve wGOAT/R&P

Thank you Dave! I have been irked by the ads covering up my news. I
disabled QuickTime and they are gone.
I was going to ask Mozilla about it and up you popped with the answer!
Thanks again and I hope you have a very good day!

10370. MTR AGC Pops and Cure

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-17 04:35:16 UTC
From: radio_kx0r
Topic: 10369 Message: 10370

Let's try this again....

MTR OPS,

After I got my MTR going, I noticed that occasionally I was hearing pops on the leading edges of CW signals. This is a common issue with audio-derived AGC circuits, and much has been written about this subject. I found a partial cure for the pops, good enough for my ears, and it's really easy.

Pops occur because audio-derived AGC occurs after the fact, and there is a delay. If a really strong signal suddenly comes through the receiver, the gain is high, so the first part of the signal gets through to the output before the AGC has time to cut the gain and level the output. On a scope there are sharp peaks on the leading edge(s) of the first strong signals. We can clip these sharp peaks and reduce the impact on our ears. If the clipper is placed before the MTR's audio filter, which is in the output stage, the effects of clipping are somewhat mitigated.

There already is a clipper on U3a; Steve has used this circuit in most of the ATS rigs. I believe Its purpose is to clip really large transients before they go through the audio chain. It apparently has little effect on the AGC pops, probably because the normal signal level in U3a is too low to push much through clipper diodes D1a and D1b.

My clipper consists of two reverse-parallel 1N4148 diodes connected between pins 2 and 5 of U4 (LM386) intermediate/AGC amp. A 0.1uF blocking capacitor also is included to prevent the DC level of the output from connecting to input pin 2. U4 is not a normal op amp, so we need the blocking cap.

The clipper certainly reduces the pops, but at the same time it prevents these pops from propagating full-strength through U4 and then to Q2, Q1, and around the AGC loop. So the clipper actually slows down the attack of the AGC, which is not the best thing. So we trade one problem for another. It's a compromise. This clipper does not change the sound of weak or normal signals - it only affects signals that are suddenly strong.

If you don't like the pops, try this circuit. I suggest you just tack it in so you can connect and disconnect it while listening to some strong signals. Out here my favorite is W1AW on 40M. Let your ears decide.

I'll post the circuit in the Files section here.

Perhaps someone will create a better AGC mod and post it here.

10372. Switches on MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-02-17 17:59:17 UTC
From: radio_kx0r
Topic: 10372 Message: 10372

MTR Guys,

I just cut the plastic actuators on my MTR so they're about 1mm high now.

Just take a sharp pair of flush cutters and cut them neatly.

Why?

The actuators are meant to go through a moderately thick panel. With an Altoids box they're too high. They're likely to be broken off in the field or in the pack. If they're broken, they will probably break off too low to be easily moved.

Also they're easily bumped when the rig is on.

They feel nice at 1 mm. Nothing is lost but a little bit of plastic...
Your choice.

Thanks to whoever it was that posted this vulnerability earlier...

Date: 2013-02-20 14:58:43 UTC
From: cloud runner
Topic: 10373 Message: 10373

Does anyone have a one-to-one graphic of the ATS4 ???????? The nice graphci in the manual in PDF is small, and I can't extract it to re-size it. I want to do a decal graphic of it in actual size to put over a project am making.

Steve?

tnx

From: William
Topic: 10374 Message: 10374

I'm building a MTR from the last run and am at the point of mounting the tac switches. It occured to me that the new enclosure offered by Steve might be thicker than an Altoid's tin.
Will the length of the switches be enough to pass through the new box or should I wait to get longer ones?

Bill, WV1N

The thread for your QBSA never says it sold.
Is it still available?
Please advise.
Thank you.

To All;

Allow me to change the thread of this group, and ask if anyone has any idea of where I can find a mcroSD 32 GB memory card, I've been searching the whole Internet for that little chip, to give my "mp3 music player" device a lot of room. The one I got in, with very little input from the people who make the device, turned out to be for "mobile use", and the indicator on the screen didn't recognize it! I'm totally mystified, and now have a piece of thumbnail-size artwork to put on my bulletin board, "caveat emptor"!

If anyone has an idea, please respond directly, off the group.

Thanks, 73's
Gil WA5YKK

10378. 32 gb microSD

Yahoo group: AT_Sprint (2012 — 2013)

Gil- probably should have started a new thread instead of hijacking another.

As for the 32gb microSD card, that's a bit like asking "where can I get batteries"? They are everywhere. I bought a couple 32gB microSD class10 samsungs off eBay and they work fine in my Asus TF300T tablet. They are available from eBay, NewEgg, Amazon, Staples, and just about any other technology place you can think off. The one you have may be fine, just not formatted properly for your MP3 player (FAT, FAT32, NTFS, etc.) Also, are you sure your player can recognize a card that large? some older ones can't.

Steve;

Thanks for the return, and the chip I got in a few days ago does fit fine, I'm now wondering if the contacts in the "ZEN Style M300" player are able to mate with the fingernail-size card, or if the card is OK for FAT64, NTFS, whatever. The little advice paper makes note of 32 gb, which is why I went for that size. I'm a bit astounded, the printing on the back of that palm-sized player has 16 GB on it, so it can handle a lot more MP3 files than I've already put on it. All I wanted to do was see how far I can push this little thing, then a devilish idea came up, it can do "Bluetooh", I decided to fire up my Jambox system for my cellphone, then see if it could handle a music stream. That didn't happen, guess that they're on different frequencies, so the other idea will take some work - I recalled a now-vintage idea of using a remote RF system to listen in on one of my HF rigs, have an earphone going so I could keep track of anyone on a RACES or ARES net frequency, while I'm 100 feet out in my yard..
That might be stretching things a lot, but it's a nice idea, considering the cost of all this.

Yep, I have to be extra careful about buying Asian made devices that "can take expansion chips", make sure they're the same vintage as the thing I got, my digital camera has the big chip that I plugged in, does nicely. I'd swear that the Asians have "obsolescence" built into every item they make and send to us!

Tnx, 73's, I've got to think about the rig(s) that need attention, along with antennas and finishing out the upgrade work on my cabins.

Gil- Of course it "fits fine", it's a microSD- that describes the size, and "pinout", data transfer, etc. The issue about handling 32 gB is not physical size, but data capacity.

As for the Zen- it's made by Creative, a well known tech company that made it's name originally in Computer soundcards. "SoundBlaster" is their line of cards, you may have heard of them.

Getting back to the Zen- Creative's own webpage (found by a simple Google search on "Zen M300"), shows certain cards are compatible, some may not be. Here's their web page that discusses this:

http://support.creative.com/kb/ShowArticle.aspx?sid=95138

Perhaps this will help you.

Bruce;

I've been using the Creative Labs sound cards for a very long time, very fine systems for music and sound effects, "surround sound", et all. When their players first came out, I got so into them that I now have two of the originals, their only problem is using up batteries. Both have FM receivers built in (!) and I need that for weather reports here in "hurricane alley".

Looked twice at the contacts inside the little square player, same number as on the memory card, so this is going to be a mystery to figure out.

I'll look at and print out the page, might make a difference somehow.

Thanks for the extra bit of advice, I'm feeling like a caveman now!

Very nice! A 10W PEP 80M SSB rig for $100, with enclosure.
Might suck away a few MTR customers to where it takes
a few more hours to sell out.
Note that you can choose which panel decals to stick on.

There is a whole lot of air time spent attempting to attain "THE BEST".... one of these.. or those. Now.. with the understanding that "THE BEST" is a personal preference sort of thing. There are ways to measure the ability of this radio, or that radio.. to ascertain which does a specific task best.. as measured...this way... with this equipment, that is NIST traceable standard. Most folks don't want to do that type or detailed a process to measure "THE BEST". So... that being said, I will put it this way.I have measured a large number of QRPkits and KD1JV kits, and Elecraft kits.Each has its own footprint, and each holds its own in its own special way. IF I had to pick a particular rx... that hears the most sensitive, with the least amount of background noise or noise floor.Specifics please.... The MDS ... from the KD1JV kits will usually come out better by a db or maybe two over the more sophisticated radios. HOWEVER.. the KD1JV designs rely upon an effective xtal filter to keep the audio controlled when the band is crowded. The K1, K2 Elecraft radios utilize a whole lot more than that.. and it really is unfair to compare a multi hundred dollar radio to one that prices very nearly a single hundred dollar bill. Yet... you will be surprised, by the amount of contacts you can make with the radio that you got for $100 or so, if it is a KD1JV design, or one from QRPkits. Now, to be fair, I haven't measured enough of the "other" kits to make a full blown side by side comparison... if some one wants to see that... I intend to keep the specs and will present that at a later date. I think I would prefer a TriBander.. or PFR3.. for the field work, unless I am cramped for space or weight.. then the MTR or ATS series jump to the front, and usually into the pocket. The new Survivor, hasn't been tested.. but the lineage suggests it will be a player to contend with. Is anyone interested in deeper more specific details? I may be able to present something like that, later.. with more radios to average in, it becomes more valuable.

Have a great day,

I'm very interested in any numbers you come up with, please post them.
However, as you note, personal preference is a very big part of it.
If you want a compact SSB phone rig on a budget, the Survivor looks
very nice. But the MTR has an incredibly stable DDS VFO even in
severe conditions, and is optimized in many ways for the more
QRP friendly CW mode. If you're out backpacking for a couple months,
a miniscule receive current is more than just another number.
And for me at least, it mostly comes down to a personal preference
for the rig that is more fun to operate. Whatever that means.

10393. Buddy Stick vs. AlexLoop Walkham

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-06 20:01:07 UTC
From: Chris Maness
Topic: 10393 Message: 10393

I am going on a cruise in a couple of weeks, and I have narrowed down my antenna choices. The Buddy Stick, or the AlexLoop. Which one would be the most effective for a ship balcony on a tripod or rail?

Thanks,
Chris Maness

Alex loop - a buddistick would be pretty unwieldy, especially in the wind off the side of the ship.

What line are you going on? Most do not allow ham radios anymore...

I don't know...but I would take the Alex Loop for ease of packing and set up. With a good rf ground, the BS would seem to be stronger, but its length might create problems. I have both.

I am going on a Disney cruise. The Carnival captain allowed it on the last
cruise I was on a couple of years ago.

Thanks,
Chris Maness

I agree on the loop. The Buddistick is great, but on a ship... You have to think about the counterpoise, which works best perpendicular to the antenna, and is quite long on 20+m. And there is the wind problem of course.

Gil.

I would go with Buddy Stick because it does have a counter poise. The metal hull and salt water below will make for great performance. I used a short whip with counter poise in the pacific and was amazed by how well it did work.

I received permission while aboard on the Carnival ship. I will be emailing Disney, what I have read is that they are ham friendly.

I am only running five whats, so QRM with the ship's radio room should not be an issue.

Thanks,
Chris Maness

Chris,

Disney Cruise Line ships are registered in the Bahamas. Did you get a Bahamian Reciprocal Operating License?

From: Milton Riutort
Topic: 10393 Message: 10403

Wow, if you have the permission the Budstick may be a good performer even having to manage the counter plain cable space. My mobile antenna is an MP1 Superantenna that works quite well in front of the sea. In theory the vertical antennas are very good at sea level. But your are not exactly at sea level, so everything is possible.

Let me suggest this:

Evaluate which one is the easy to carry and setup and make your decision not only on the performance of the antenna.

Remember also how the loop is affected with the surrounding possible metals and if this affect the complete antenna performance and setup. I have no idea of this, but you may be in serious problem if that happen. Vertical get a damage distribution pattern, but keep working after finding the correct match point.

Ja ja, still thinking on performance more than commodity.

Also, test them first on similar possible operating condition. Installing and testing your setup at home let you have all the needed parts on hand before the real setup. Nothing missing.

Make some contacts, just for fun, but operate it as normal as ever, to see how them works and to compare them after returning from the trip.

Good luck,
Milton NP4KT

I don't think I would need that in international waters. Would I? I would imagine I would need one if I was transmitting in the Bahama port.

Topic: 10393 Message: 10406

Chris,

If you're in international waters or in the Bahamas you wold need a Bahamian reciprocal license. If the ship stopped an a third country such as Cancun Mexico you would need a Mexican reciprocal license to operate there.

I don't think I would need that in international waters. Would I? I
would imagine I would need one if I was transmitting in the Bahama
port.

No, you have to apply in advance and pay a fee to get a Mexican license.

I'd check the rules on the ARRL website befor operating on board a ship or in a foreign country:

<http://www.arrl.org/maritime-mobile-operation-in-international-waters>

It also takes time to get licenses so don't forget to apply early.

The MTR rig is "primarily" for folks who climb mountains, sometimes higher than 14,000 feet AMSL, or go on long backpacking trips, and to whom simplicity and weight is of utmost importance. I agree that the ATS-4 or ATS-3b are the greatest for most uses.

I'm waiting for the 160/80 rig which was mentioned a while back, but Steve said was having complications. I'd love to have a small rig which covers the lower part of the 160 meter band.

I have activated more than 200 individual SMFF:s by foot and by bike and quite a number of SOTA:s in the Swedish high mountains far away from any kind of civilization carrying my ATS-4 in my backpack. The rig has worked flawlessly all the time. I can not see any need for anything more simple or lighter than the ATS-4. So - probably to the joy of some people - I think I will pass on the MTR... :-)

The circuit boards will be here in an hour or so. I don't have a current ETA for the cases yet, but those should be shipping in a week or two. I maybe ready by the time the cases get here, maybe not. It's almost time to help make Maple Syrup, so that could slow me down some.

I made some minor changes to the board by converting to chip caps in the transmitter filter, so of course the manual needs to be updated and still working on that. I'm also changing the way the caps are color coded as I'm running out of colors to use. I'm now going to mark the carriers with their value using the resistor color code.

I've also decided to eliminate the pocketdigi mode since I belive that feature has pretty much run it's course. The calibration mode has bee simplified as I'm using clocks with 20 ppm accuracy which should be pleanty close "as is". The 100 ppm clocks were typically really close and these new ones are 5 times better.

So, keep tuned, it won't be too much longer...

Thanks for the update Steven, it's good to hear that the new batch of MTRs is progressing well.

Sounds like the rig will be even better than before :-)

I think I have decided that I would like to get a case for MTR #131. The Altoids tin is serving me well but the new case sounds very smart.

I know that there is a sizeable group of interested hams in the UK all wanting to get their hands on an MTR this time around, so I do hope that you make a suitable payment option available to us.

Thanks Steven, great job, 73

Colin, M0CGH

Steve-

Excited to hear of your progress! I've been waiting for my shot at an MTR since last Spring.

There must be some connection between QRP and maple syrup, but I've haven't figured it out yet. :)

Regarding PocketDIgi, I was actually looking forward to playing with the MTR in digital mode (I have an old Jornada PocketPC), and maybe there are others who'd like to try this as well. It's a feature not found in most small transceivers. Are you needing to clear up program space on the processor? Would I be able to flash an old version of the code if you make the change, and still use the MTR with digital?

Thanks,
Wayne
W6AHH

Woo-Hoo..... got my ATS-4B today..... I sent it to Dale 7 months ago, and he got it to me in time for a trip to Germany this summer.

My first question..... I have paged through the manual 3 times now. I admit I have only had 4 hours sleep in the last 28 hours (nights suck), but I have not been able to find anything absolutely certain about the power polarity. And that isn't something I want to experiment with.

Is it center pin positive?

Thanks all.

Mike - KD9KC.

Methinks the DDS doesn't run fast enough on the low cost MTR, so it
won't run on 21 MHz. One of the considerations is that a faster DDS
consumes more power, and power consumption is one big consideration of a
very lightweight rig.

That's what my recollection is ofthe thread a few months ago in this
conference, but short term memory fades rapidly as one ages, so this may
be incorrect.

Good morning Steve.

You were absolutely correct. I was too sleepy last night to think of that. Following your directions, it came right up. And I was met with another surprise. The photos, and the one I borrowed had an orange display. Mine is green. Not sure it matters to me, I was just expecting orange. I think I actually like the green better.

Looking forward to a first contact with it later today, and many fine outings on SOTA summits, dog shows, and whatever other boring places I end up where it can play.

Thanks again.

10436. ATS-3b Help! High receive current and hot ICs

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-09 21:44:36 UTC
From: dk7fh
Topic: 10436 Message: 10436

Last year I gladly received a original packed ATS-3b kit (Final Sept. 10 2007 with V 1.8) and meanwhile I assembled it and it worked from the beginning (Still cannot believe it!!!).

I already had some fine qsos on 40m and begin loving this amazing little rig! My compliments and thanks to the constructor Steven!

Some day after a qso as I touched the circuit board it was quite warm. A closer "feel" showed, that U8 and U9 become good warm even in receive mode when working with 9V and really hot when using 12V. As I measure the receive current, no signal, it is 100mA, which seems a lot to much.

So I did troubleshooting back and forth. Controlling the soldering with a real good binocular loupe, checking that I put the right parts in the proper place and so on. I also measured the voltages and found some but as I believe not dramatic differences to the IC Voltage tables.

As I returned to the initial checks (without L3) I recognised, that the PA Gates of Q6 to Q8 were not 0 V but 0.8 V.

So what can I do? Mounting some little heat sinks and providing enough battery capacity?

Thankful for any hint!

Frank, dk7fh, Cologne

Should be fixed, or something might fail eventually.
U8 should definitely pull those gates all the way to ground.
If you have a scope you might make sure that it is 0.8 volts DC,
and that you are not just measuring the average of a 7MHz signal.

My best guess would be a solder short under U8.
Unfortunately the manual in the files section for the ATS3B
is missing a few pin numbers for U8 in the schematics, and
the schematics are inconsistent with the photograph in the
manual showing pin 13 of U8 driving the FET's. I don't know
how U8 is actually wired as I do not have an ATS3B.

Check for shorts around U8, perhaps using an ohm meter and
sewing needles for probes. If you don't find anything,
then power it up from a 9 volt battery and record the voltages
to ground at each of the 14 pins around U8 when in receive mode.
If L3 is back in, there should be no voltage you can measure
to ground from either end of L3 when in receive mode.

Let us know what voltages you see.

Dale,
I doubt it is just a matter of damaged FETs, Q5 should be off
during receive so there should be no power through L3 that would
pull the gates up to 0.8 volts even if the finals were internally
shorted.
The drive to the finals is U8, which is where I asked him to take
voltmeter readings. Let us know if you have any ideas on a
specific procedure he might try. I assume he has no scope.

Thanks a lot for your quick answers, Jerry and Dale!

I will do some more measurements and ask neighbor-hams who have scopes to help me.

The finals seem to be ok. In comparison to my FT-817 the power output is as expected. And the rest works fine as well. I am just afraid of damaging my kit by heat and overcurrent.

The dicrepancy between the schematics and the wirering on the cicuit board is a problem now. I will check the fotos I took from the board before assembling.

You will hear from me as soon as I have some new infos.

10441. FS: QSBA

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-10 16:09:34 UTC
From: on7bny
Topic: 10441 Message: 10441

Hi all,

cleaning up the desk... have a 90% completed QSBA for sale.
What's not completed? I never found a proper enclosure, so connectors & standoffs did not make it to the board yet. Otherwise in pristine (unused condition)
I'm letting it go for $50 + shipping cost (tbd).
please contact me off-list, emails will be processed in order of arrival...

best regards,

Benny.

Hi all,

cleaning up the desk... have an unbuild MTR gathering dust. Still did not find the time to build it, and anyway realizing my ATS4 meets my needs more than an MTR. Maybe someone has a better use for it than me?
Price = $100 + shipping cost (tbd).
The ti launchpad you'll get as bonus.
Please contact me off-list, emails will be processed in order of arrival...

best regards,

Benny.

PROBLEM SOLVED !!! --> BAD SOLDERING

Jerry, Wolfgang (who called me by phone!) and Dale many thanks again for your help !!!!

How did it come?

First I obtained a datasheet of the 74AC02 (U8 NOR gates). Then I measured the voltages around this IC and pin 7 which was ment to be ground had 0.7V! And there it was. The leg was soldered but underneath with bad contact to the board.

Minutes later everything seemed to be as it should: receive current 35mA, gates of the finals 0V and normal temperature, transmitting and receiving ok.

THANK GOODNESS !

Now I am looking forward for many qsos and much fun with this tiny rig.

Good evening and good night to everybody and have a good start towards the new week!

Glad Frank, dk7fh

Frank,
Good to hear you got it fixed! I think you're done!
But I'm still puzzled as to why things were heating up.

The newer "ATS3B1" manual does show U8's pin 13 driving the FETs.
With pin 7 not soldered to board ground, power supply currents
would have to exit through the protection diodes at two input
pins that are grounded. So the 74AC02's internal ground would
be a half volt or so above board ground, and it could not
pull pin 13 all the way to ground. That much makes sense.
However, not obvious to me why it would suck an extra 70 ma.
I was expecting the problem to be something more like an output
shorted to an input putting a NOR gate in the transition region.

Good going Frank!
Glad you got your little rig working.
You had some pretty great support hams on you side!
Those little spider legs on the chips can be deceiving.
I had some problems with those on my MTR build.

Might be the parasitic PNP/NPN transistors inherent in CMOS chips:
http://www.fairchildsemi.com/an/AN/AN-600.pdf
Once you exceed the "Absolute Maximum Ratings" (input voltage
went well below chip's ground pin), most anything might happen.

If anyone out there can shed more light on this, I'm all ears.
Might accidentally learn something.

Jerry, KE7ER

10452. Tribander on 60m

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-11 19:40:43 UTC
From: win_ker
Topic: 10452 Message: 10452

I know an MTR has been modified for 60m, I just wonder if a Tribander has had the same treatment. I've ordered one for 30, 17 and 15m but would like to replace 30m with 60m for sota activations. I have 30m covered with another rig.

I'm assuming I'd need some new firmware and obviously some work on the low pass filtering.

73,
Ian MM0GYX

Ian,
See message below that Steve sent to me when querying filter component values.
It appears that 60 is already a tribander option.
Pete
G4ISJ

On 16 Jan 2013 23:51, "Steven Weber" <steve.kd1jv@...> wrote:
These are the values I came up with to put the Tribander on 60M, but are for producing 5 watts at 13.8V supply.

The PA side inductor value will likely need to be changed and the number of turns redone for a T30-2 core:

PA > 680p (20 turns on T37-2) 1200 p (20 turns T37-2 || 150 p) 680 p > ANT

As far as the receiver side I used 22 ufd inductors with 70 pfd trimmers. Since the trimmers on the MTR are only 30 p, pad approperately.

I'm not sure if Doug has started shipping kits with the processor which has the 60M band included or not. If you just ordered it, ask Doug to send the new processor if it is not already in there. I have not checked to see if the online manual has been updated to include the 60M band data or not either. If it does, then the kit will likey have the new frimware in it.

Peter & Steven,

Thanks for the replies, Steven I have just emailed Doug querying the processor. I also notice the manual has 60m option detailed on the spec. page. It wasn't an option on the order page, I'm reading on.

Many thanks for the direction.

Steven,

I may have been a little hasty, I can see the details regarding 60m now in the manual, I notice there are 5 channels representing the US shared allocation. They are fixed frequencies and if the tuning is altered it amounts to a 900hz RIT function only. I would like to operate with my NOV and observing the UK 5 meg whiteboard within the region 5.285 - 5.264 Mhz for cw. I assume this is what Peter has configured his mtr to do.

Regards,
Ian, MM0GYX

Sorry then, your out of luck. I had to configure the band to comform to US laws and I can't have two options on how to use the band. I was barely able to squeeze in the US channel configuration into the chip, I think there are about 5 unused bytes left.

10459. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-18 19:40:13 UTC
From: NAQCC
Topic: 2848 Message: 10459

NAQCC Sprint Wednesday night!

Our March sprint is this coming Wednesday evening local time (March 20, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Thursday March 21, 0030 to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201303.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prizes page on our website.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6570+ members in: All 50 States - 9 VE Provinces - 93 Countries. Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

I think everyone is just waiting for Steve to finish with the maple syrup and open up ordering for the MTR :-)

I was intending to send a post stating how much I'm enjoying operating with my MTR, but I didn't get around to it. I had the MTR out on Friday from SOTA summit G/NP-009 Buckden Pike in the Yorkshire Dales, UK.

I worked a couple of US stations and one Canadian on 20m, using the MTR with a 2S LiPo. My QSO tally was 40, split between 40m and 20m .

Not much more fun can be squeezed into an Altoids tin!

10462. MTR update!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-19 22:45:13 UTC
From: Steven
Topic: 10462 Message: 10462

Hi Gang,

The new enclosures came in from Ten-Tec today, dispite the Nor'easter raging outside. I felt kinda bad for the UPS guy who had to lug the 47 pound box up my driveway through 6" of snow. But he showed up early so I wasn't on the look out for him.

The boxes look really nice, you will be impressed I'm sure. Rats, they won't let me insert a picture to the message, will have to put it in the photo album then. I'll put it in the MTR folder.

So, we're almost ready to start taking reservations for the kit. I'll make a seperate annoucement with the details soon. I started bagging parts the other day and discovered I had been sent a wrong value resistor. I ordered 14K 1% and got 140K 1%. I also realised I needed bumper feet since we now have an enclosure, so had to order those too. They should be here by the end of the week, I hope. In the mean time, I'll kit up all the stuff I can until those two things show up and I can finish.

Oh, I decided not to change the the firmware after all. I got to thinking with all the problems I had getting it right last time, I had best not fool with it and risk inducing any new bugs. So, calibration mode is intack, along with the Pocketdigi mode.

One last thing, I only have enclosures for new, full kits. Extra enclosures for existing kits will not be ready for another month, but I'll be out hiking on the AT at that point. So, those wanting a case for thier existing MTR will have to wait until I get back the end of May or beginning of June. Sorry about that. In fact I leave April 8th, so we have to get these new kits out pretty quick.

Well - I finally got my ATS-4B, although somehow 30m isn't working on it.
Reads about 66 MHz on the display.

I just finished building a tuner for a EFHW antenna. I am looking at
building a EFHWA for 40m, 30, 20m, 17m and 15m, using either small switches
or Bullet Terminals.

http://tinyurl.com/ce2zyj5

The antenna will be set up as an inverted-L, on a 15 ft fiberglass pole.
Hope to have it working real soon now. Time will tell.

Who-else is getting ready for summer?

Subject: [AT_Sprint] Re: Very quiet on the AT Sprint reflector???

I think everyone is just waiting for Steve to finish with the maple syrup
and open up ordering for the MTR :-)

I was intending to send a post stating how much I'm enjoying operating with
my MTR,
but I didn't get around to it. I had the MTR out on Friday from SOTA summit
G/NP-009 Buckden Pike in the Yorkshire Dales, UK.

I worked a couple of US stations and one Canadian on 20m, using the MTR with
a 2S LiPo. My QSO tally was 40, split between 40m and 20m .

Not much more fun can be squeezed into an Altoids tin!

I am ordering (trying to order) the power plug for the ATS-4B. The manual parts listing says it is a PN# 163-4018-EX, 1.8mm.

When I type that part number into Mouser, it says a 1.7 x 4.4 mm POWER JACK!

Anyone got a good PN# for it, might be faster than searching through them all.

Thanks.

In looking at the manual in the files section, it calls out a Mouser PN: 171-3219-EX. The text is highlighted in red, so it was probably an update.

Steve,

Fantastic!

How can we ready ourselves to make the purchase as easy on you as possible? I recall some discussion previously, but I don't know if you settled on a method of how you'll accept orders this go around. I missed the last batch, so I'd like to be ready so I can get in on the this batch!

The case looks great - can't wait to finally get a hold of one!

Mike, there was a bug in an early batch of kits which caused the problem of reading 66 MHz which was caused when exiting the calibration mode. There was a way to avoid that from happening, but now that it has the only way to fix it is to re-flash the chip. I would be happy to do that if you send the rig to me.

Thank you Scott. Yeah - the part number in my manual (also in RED) turned out to be the chassis jack, not the plug.

I actually had the drawing of the one you indicate on my screen when your E-mail came in. Just ordered 10, a lifetime supply.

Thank you much sir...

First, the price:

$120.00 plus postage, shipped priority mail, flat rate.

Please email me direct to order/reserve a kit : steve.kd1jv@...

Subject : MTR order

Please include your name and address which I can cut and paste to make a mailing label with. I will confirm your order as soon as I can. It might take up to 24 hours, so don't frett if you don't hear back right away.

Once confirmed, US orders please mail check or money order with $6.00 postage ($126.00)

DX orders (Including Canada) can use PayPal, I will send you a link when I confirm the order. Postage to Canada is $14.00 and any where else is $24.00. International Priority mail rates took a big jump recently. Insanely expensive, but it does get you the package in a reasonable time frame.

Thanks!!

10486. MTR Build Soldering Question for Prior Builders

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-20 23:50:42 UTC
From: wheeler2roh
Topic: 10486 Message: 10486

So, now that I have placed my MTR order, I've plugged in the soldering iron and am waiting by the mailbox :) Thanks Steve!

Something on the MTR construction I'd been wondering about.

Am planning to use soldering paste to build the bottom side (Side with MSP430) that has most of the SMT components. This would be with hot plate and embossing gun.

My question is on the SMT components on the "top" side. There are are fair number of SMT resistors and capacitors on this side, as well as two SMT IC's. Since I can't put the board on the hot plate at this point (bottom components in place), am I forced to hand solder everything on this side? I haven't done "embossing gun only" with solder paste, but maybe that works.

Was just wondering what prior builders found successful.

Wayne
W6AHH

Hi Wayne, You could try that... if you just have to. However, I've had a whole lot better luck with using the solder paste on either side.. or both sides,and using four pennies to stand the board off the cup warmer ... on both sides. Careful handling.. is called for of course.. and one more note....I NEVER move the board, after the solder has flowed on the second side.. until the cup warmer has cooled on its own. I'm sure there are lots of other suggestions, but this is the best I've found after building a doz or so MTRs. Good Luck!

Have a great day,

Subject: [AT_Sprint] MTR Build Soldering Question for Prior Builders

So, now that I have placed my MTR order, I've plugged in the soldering iron and am waiting by the mailbox :) Thanks Steve!

Something on the MTR construction I'd been wondering about.

Am planning to use soldering paste to build the bottom side (Side with MSP430) that has most of the SMT components. This would be with hot plate and embossing gun.

My question is on the SMT components on the "top" side. There are are fair number of SMT resistors and capacitors on this side, as well as two SMT IC's. Since I can't put the board on the hot plate at this point (bottom components in place), am I forced to hand solder everything on this side? I haven't done "embossing gun only" with solder paste, but maybe that works.

Was just wondering what prior builders found successful.

Thanks Dale-

I guess you don't have any problem with SMT parts on the bottom loosening up while you're heating the top of the board with hot air?

HI Wayne, I've tried and tested with the first board... two or three times... to get the heighth (how many pennies high) so the heat from the cup warmerhas to be added to.. with SOME SLOW application heat from the embossing gun... or heat gun.... my embossing gun threw way too much air..and I melted two of them before I figured out how to slow the air flow and cool them a bit before blowing the parts across the room to never be found again... the cans of drink are NOT the only things that have Wheeiiiiinngs.....you see. IF you can feel the air blowing... from the embossing gun... you are too close. IF you don't really feel the air... but feel the heat... that's just right. Good Luck,

Have a great day,

Wayne, I used a cup warmer and embossing gun on both my MTR and 3b. I didn't have any problems. my cup warmer is not hot enough to melt the solder, just preheat. The embossing gun from the top directed straight down did the trick after that. I moved the gun around in small circles watching for visual evidence of the paste changing phase working a small area about the size of a quarter at a time.

I found blowing straight down was important to keep the parts from blowing away. Surface tension kept all of mine in place. Don't tempt fate by jarring the board while you are working.

I hand soldered only the display as I recall.

Both radios worked the first time! I hope yours does also.

I've seen many "substitute products" on the market already.
They are more expensive and will often disgust you from building radio kits.
Great for breaking the addiction.

Dale;

Here's a zinger for ya - my Dad built his version of a family house, starting in 1938, took him four years to do the whole job. To get to the upstairs area where we live, you have to climb 12 steps to the second story porch. I don't regard that as "12 steps for a program", but there is a strange part about my life, my Dad was a fishing fanatic, he would go out "to try catching a nice one for dinner", and actually stay our all night long! I forgot how many times he arrived back home, two long "stringers" of fish, grinning like a sane man.
When I first tried to set up my ham radio dipoles, I wondered why I couldn't hear anything the second day, he had "torn down those wires, he hated the whole idea, it made more sense to go fishing". My persistence is all that kept me going, then my Mom made him leave my radio antennas alone. To this day, I have the creepy feeling that "casting out a hook to bring in a big fish" is a form of mental illness!

Enjoy playing with the MTR, keep Steve busy!

I think it took me about a month to build my ATS-3B (incl the band modules).

Part of that is because I still work full-time, part because it was my
first smd kit and part because I was doing it for fun so if I was a
bit tired I didn't do any that day.

Wow, good work Steve. They really did go quick, I've been watching on a daily basis for new messages, except for the day that counted, I was building a Weber Tribander and got too absorbed in the soldering, oh the iron-y.

Well, good luck to those happy few.

Tribander should be qrv this weekend.

I will be building my MTR with a soldering iron, one component at a time.

I believe it's the best way to get a neat looking job, and I'd be more confident at the quality of the joints.

Using paste brings it's own difficulties.

My previous MTR works like a charm and has never had a problem, it even passed it's smoke test first time.

http://m0cgh.blogspot.co.uk/2012/06/kd1jv-mtr.html

I vote iron!

Just to balance up the debate :-)

Man I love my MTR and can't wait to have one for the other bands!

149. #150 is mine. Serial numbers will actually start at 151, since there were also 150 in the first batch last year.

Yes, Ten-Tec did a great job and at a fairly resonable price for a small run. I sent them a cardboard model of what I had in mind for a case and they took it from there, making some significant improvements.

The last couple of parts I need showed up today, so I had best go back to work...

Topic: 8679 Message: 10508

I'll upload a new manual soon. I just need to add few pictures of the new enclosure. No doubt the eagle eyed, nit picking proof readers will find a few things I'll need to correct, (which I really appreciate) so would like to do that real soon.

The new board is almost identical to the first one, but I changed from using through hole caps in the low pass filter to using chip caps.

I'm also trying a new color coding scheme for the chip caps, which uses the resistor color code to indicate thier values instead of using random colors. Which turned out to a real time consuming pain in the butt to do until I thought of making a jig to hold the parts tape or spool.

Here's a pet nit of mine. Schematic should read "MSP430".
There's nearly 10 years worth of hams out there now
wondering why Digikey doesn't stock an MPS430.

Great kit though! Nothing else available that touches it
for what it does. At any price.

I'd still like a future version to use a 38 pin MSP430F5***,
and maybe the EA DOGM163W-A display as an option.
Or at least have an easy way to add a daughterboard
with a better processor that holds the old processor in reset.
Would be interesting to pursue that PSK31 code I have in
the files section a bit further someday when I have the time.

Maybe an option for a good low friction rotary encoder, add a
weighted knob when at home so you can fling it across the band.
Encoder to be supported directly (proportional to speed) by
MSP430 code, not just a novel way of pressing the up/down buttons.

Perhaps one band hard-wired in, the second band a plug in?

I think you could drive an IRF510 directly from the AC02
if the gate was capacitively coupled with a couple volts
of DC bias. The extra gate capacitance might drag it down
some on the upper bands though. That should mostly solve the
blown finals thing. Except of course for those hot-rodders
that choose to feed 24v to the IRF510.

Perhaps none of those are a good idea. But I would someday
like a rig for which it is easier to hack in new features.

Hey Jerry,

I don't want to derail this conversation from the MTR, but have you seen or heard of the Etherkit CC-1 by any chance? It's a monoband (40m or 20m right now) SMT kit and it'll ship with a nice little enclosure. It's currently being beta tested. Here are some initial impressions by one of the beta builders: http://aa7ee.wordpress.com/2013/03/21/the-etherkit-cc1-1st-beta-a-trail-friendly-qrp-cw-transceiver/

As far as hacks go, it's got an AVR programmer header on it, GPS input for future hacking (timing for WSPR or HF APRS functionality via PSK). There's also access to some interesting information like the VFO frequency, keyer info, RIT, memories etc etc. So you could easily build a little display for it if you wanted.

All of the documentation, firmware, and schematics are on Github for easy viewing/hacking.

https://github.com/etherkit/CC1

And here's a blog post from the builder of the kit, Jason, NT7S with specs on the kit and information about the breakout headers on it and such. He has a few other posts about it too, one recently of his first CC-1 to CC-1 QSO with AA7EE.

http://www.nt7s.com/blog/2013/01/first-rf/

Anyway, MTR #79 from the new batch here. Anxious to get it and begin the build. I'll likely be building for 40m/30m as I will likely be getting the CC-1 as well and will build it for 40m, or some other combination so I can have the 3 bands covered by the two very trail friendly rigs.

73!

Well, no matter what features a rig has, someone will want it to do more.

I will never be convinced rotary tuning is more desirable then push button tuning on a rig this small. That said, I was sorely tempted to see if I could add encoder support to this run as there is just enough space to mount an encoder off the side of the case. Maybe later if I find time and ambition.

If I do another version with LCD readout I'll use something other then the EA DOG displays. Thier just a bit too fragile and several builders broke thiers during assembly.

The BS170 finals have proven to be very reliable. Some care must still be taken, but thier much less fragile then the 2N7000's originally used. The IRF510 would not be a very good replacement.

> Here's a pet nit of mine. Schematic should read "MSP430".
>
Some day I'll remember to fix that. At least its right on the parts list - I think.

> Perhaps none of those are a good idea. But I would someday
> like a rig for which it is easier to hack in new features.

This is possible, but not easy on a board this small.

Hi All

Unfortunately I missed out this time around - too slow ;(

I already own one of each of the models of these wonderful radios as I am keen on collecting them, and although I am happy knowing that perhaps someone who has been waiting to get hold of their first one might have got one, I would still dearly like to buy this latest model with the new case. My preference would be to buy an unbuilt one, however if thats not possible, I would consider one that is built, tuned and working.

Congratulations Steve on putting out what I am sure is yet another fine radio kit! Enjoy your wander on the AT.

Holding thumbs like mad,

Andrew

Overall design borrows from the ATS rigs, but tries not to copy.
Fair enough, hams have been borrowing like that since about 1910.
The board mounted connectors and extra headers are nice.
I've never used an AVR, but suspect I'd prefer a 16 bit 25 MHz MSP430.
Single band, no AGC, the balanced output filter means a bit less
power out. I wonder how well it does at under 12v. Lots of coils
to wind. Still in beta, not shipping anything yet, might be a few
bugs. Worth considering for those that missed out on the MTR.
Anybody notice anything that is an improvement over the ATS line?

Didn't realize it was an EA DOG on the ATS4. Maybe solder it
directly to the main board, would that be stronger? If it fails,
pluck the pins out one by one? I've only seen datasheets.

The rotary encoder and more power are things that seem to
excite considerable interest within the group at times.

Yes, the rotary encoder is probably best left at home.

I'd try slipping in an IRF510 at 24v before building a linear,
perhaps with a buck-boost switcher that's only on for transmit
so you can efficiently choose your output power level.
Would need to beef up the output filter components for the
higher voltages and currents, but not change the values.

And none of that adds to what the MTR is trying to be,
a compact multiband $100 kit that performs really well.
But would be cool if the hooks were there to optionally add
such capability. Cuz it's fun, if for no other reason.

10521. Batteries for the MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-22 15:44:12 UTC
From: TJ Campie
Topic: 10521 Message: 10521

So with the new cases, Steve said there'd be room to put a battery internal to the unit. How much room? Obviously room enough for a 9v but there's some pretty small 3S LiPo batteries that run at 11.1v at about 1300mAh that would be perfect.

So Steve - how much room would you say there is for a battery?

From: brianpepperdine
Topic: 10486 Message: 10522

Well, for better or worse...I got a hot air SMD Reflow station. The MTR will probably be the first real thing I build with it.
However, I have a couple small SMD projects I intend to start with.. one of which is the Hendricks QRP Kits Dummy load.

Anyhow, some weeks back George the 'build it' guy on the Twit TV HamNation videocasts (hosted by Bob Heil) had shown the hot air SMD reflow station he had recently obtained. It was about 69$ on special, and he used it on the last stages of the Soft Rock kit he was doing.

Anyhow, it came to pass that the same station (under a number of names) came up on eBay from a local supplier local to me in Canada, so I got one. I was concerned about the velocity of the embossing gun air, though LOTS of fellows have used them, figuring at the cost I would indulge in a reflow station with adjustable temp and air flow.

I will use that, probably with the griddle I got in WalMart 2 years ago after LobsterCon New England QRP gathering in Maine, on the suggestion of Steve as a pre-warmer. And of course I will be able to flip the board over, put it raised up on pennies and then reflow the components on the other side, using solder paste.

Dunno, the griddle pre-heating might be redundant with the reflow station, but I can play around and see. On-line videos I believe do show pre-heating being done in conjunction with hot air reflow and solder paste.

These eyes will never see (ha) me do SMD with a soldering iron.

pennies to stand the board off the cup warmer ... on both sides. Careful handling.. is called for of course.. and one more note....I NEVER move the board, after the solder has flowed on the second side.. until the cup warmer has cooled on its own. I'm sure there are lots of other suggestions, but this is the best I've found after building a doz or so MTRs. Good Luck!

Interesting idea indeed...although I wonder if the initial 12.6 volts for a fully charged 3S LiPo might be a tad on the high side for the MTR without a diode or two to drop it? I thought 12V was the absolute maximum and better to be between there and 9V?

Hi Brian, gentle and slow... nothing real fast... that's the key... to preheat and airflow. These little critters are skittish.. and fly at the first hint of any movement... so plan ahead... and go slow.The Hendricks dummy load is a great practice piece.. and one more hint.. if you use tweezers.. to pick up parts... Put a large sheet of plastic under your work surface, and under your grounded mat, with the edges tipped up, to catch the flyingcritters as they try to escape. This will work for the first kit.. practice or otherwise.. until your fingers learn very light touch..Good LUck!!!

Have a great day,

Anyhow, it came to pass that the same station (under a number of names) came up on eBay from a local supplier local to me in Canada, so I got one. I was concerned about the velocity of the embossing gun air, though LOTS of fellows have used them, figuring at the cost I would indulge in a reflow station with adjustable temp and air flow.

I will use that, probably with the griddle I got in WalMart 2 years ago after LobsterCon New England QRP gathering in Maine, on the suggestion of Steve as a pre-warmer. And of course I will be able to flip the board over, put it raised up on pennies and then reflow the components on the other side, using solder paste.

Dunno, the griddle pre-heating might be redundant with the reflow station, but I can play around and see. On-line videos I believe do show pre-heating being done in conjunction with hot air reflow and solder paste.

These eyes will never see (ha) me do SMD with a soldering iron.

However, I've had a whole lot better luck with using the solder paste on either side.. or both sides,and using four pennies to stand the board off the cup warmer ... on both sides. Careful handling.. is called for of course.. and one more note....I NEVER move the board, after the solder has flowed on the second side.. until the cup warmer has cooled on its own. I'm sure there are lots of other suggestions, but this is the best I've found after building a doz or so MTRs. Good Luck!

I think you can program most of the smart chargers used for LiPos to cut off at a certain voltage, say 11.9 volts. It's something I'd thought about.

I was also wondering about using a 2S battery - that would be 8.4 volts at full charge, dropping to 6 to 6.6 volts (depending on your philosophies about how far you can draw down a LiPo!). I've meant to look up the minimum voltage for the MTR but haven't yet - it's in that same neighborhood, isn't it?

I also didn't realize there was room in the MTR case for even a 9 volt battery...that's pretty cool, especially if one of the primary lithium batteries will fit.

On my first run MTR, at 9v the power out is only 2.5w. With a fully charged 8AA cell pack, I can get a solid 4 or 5w. For portable ops, this is what I'm shooting for which is why I'm looking into it this way. I can always carry that 8 cell pack but I figured something internal would be great. I want to make a super minimal MTR portable kit.

I use a tiny SP switch and diodes to drop the voltage tuning, and intially, but you can program your charger to stop at any voltage you want.

A 3S LIPO is a fine idea, and I don't think the fully charged voltage is a problem. A bigger issue is not using a 3-6 db pad between the rig and the tuner/ant when adjusting for low SWR. My much used and abused ATS3 finals can testify to that.

The charging connector could be brought out of the case somewhere (cut/file a hole in a corner perhaps) creating a really convenient power supply. A balancing charge must be used otherwise excess heat may be generated in the battery, something to be avoided. The RC guys know all about charging these, so check out the charges they use. I havent had personal experience with LiPOs burning up, but know some guys that have. The reason they flamed up was that a non balancing high current charger was being used. Using the proper charger makes a fire a non issue. Here's one I use and can recommend.
http://www.rcgroups.com/forums/showthread.php?t=511444

My normal /P batt is a 4AH LiFePO4 and lasts for a looong time. One way to get around the high initial voltage is to use a buck boost regulator between the battery and rig. That has worked well for me for a coupla years. The regulator is rated at 1A, is RF quiet, and cheap on Ebay.

Hope this helps with your LiPO decision, I like them much better than SLA's for portable ops.

I love this radio stuff !

I run my MTR mainly from a 2S lipo, 1000mAh.

The battery easily manages a few SOTA activation before needing charging. I have run my MTR from a 3S lipo that had been run down to under 12v, the rig was fine.

I generally carry 8 off AA NiMHs with me as a back up. The voltage of the charged AAs is just a shade over 11v and my MTR puts out well on to the way to 5w on 40m at this voltage.

I find that the 3ish watts from the 2S lipo is more than enough, I've worked across the Atlantic many times with this set up.

10534. Internal Tuner In MTR?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-22 20:06:16 UTC
From: wheeler2roh
Topic: 10534 Message: 10534

Looking at the pictures in the new MTR instructions (Steve is busy kiting, but what else do I have to do until my MTR comes? hi), instead of an internal battery I was looking at an internal tuner (or at least storing one inside). I think I can make a spare KD1JV Altoids tuner kit fit. If I build for 40/20M, I would only need to cover that range.

Wonder if there would be RF bleed through issues for an internal tuner sitting on the back of the MTR?

Wayne
W6AHH

P.S. Regarding a VFO knob for the MTR, I have one of Petr's Rotary Encoder kits

http://diy4fun.blogspot.com/2010/02/rotary-encoder-for-ats-assembly.html

I plan to try to adapt to my MTR. This would be in a separate enclosure with Digital readout for QTH use. Encoder could fit inside MTR (?), but I don't want a knob sticking out of mine.

> Is it specified anywhere how the digimodes interface works, protocol,
> levels etc.? Or do I need to attempt reverse engineering?
>

The interface between a sound card and the rig is simply a resistor and isolating cap (which might not actually be required). This is shown at the end of the MTR instruction manual. Along with operating instructions.

However, the Pocketdigi program is the only program which will talk to the MTR or other ATS rig starting with the 3B. This is because since there is no "audio in" like on a SSB rig, the program must directly talk the processor and tell it how to control the DDS chip and key the rig. Since this feature is unique to the ATS rigs, no other digimode program has bothered to incorperate it.

I'm not sure if Voltech ever published the interface spec's for the audio UART used to communicate to the rig. probably not, since it would be unlikely anyone else would be interested in writting a similer program. It is open source however, so if you want to play with it one could. The program can be found on sourceforge.net and I think somewhere in the group files section.

The rig will work fine down to 5.5V. Below that and the 5V regulator starts to drop out and when you hit 4.5V the '612 mixers start to not work so good. I haven't measured the power out at 5.5V recently, but it's close to 1W, a perfectly useable power level.
Let's see that CC-1 rig do that (:-)

KD1JV

I was also wondering about using a 2S battery - that would be 8.4 volts at full charge, dropping to 6 to 6.6 volts (depending on your philosophies about how far you can draw down a LiPo!). I've meant to look up the minimum voltage for the MTR but haven't yet - it's in that same neighborhood, isn't it?

I also didn't realize there was room in the MTR case for even a 9 volt battery...that's pretty cool, especially if one of the primary lithium batteries will fit.

There certainly is room enough for some batteries in the MTR case (LiPo or 9V), but no power switch. Well, thinking small makes me kinda smart, you know ;-).. Don't know exactly how the power connector will look like with the MTR, but with other small rigs with little room for a power switch, I use the following cheap and unelegant trick:

most coaxial power connectors have some kind of built-in switch, allowing to bypass the internal batteries when plugging an external power supply. With a "blind" coaxial plug having its rear side cut off, so that it has a very low profile, one can interrupt the rig without having a switch.

Sure the "blind" plug can fall off during transport and drain your batteries in your trousers pocket. If you are like me, you will most liklely loose the "blind" plug while operating and have no way of switching off the rig after party. That's why McGuyver has his Swiss-Knife for: open the case and cut the red wire...HI.

Another posibility would be the stereo jack connectors for headphones or/and key. They also have some kind of internal switch, mostly for bypassing the internal loudspeaker (when existent). But not all jack connectors have the switch lines separated from the audio path, needing some kind of extra AC-DC separation and maybe an additional MosFet (like ATS4).

Have fun es best 73!, Razvan DL2ARL

Yea, that's not good. I also don't know why he only gets a little over 2W with 12V supply. The FDS86106, while having a bit more gate capacitance then three BS170's, it looks like it should switch fast enough.

I just got back from a SOTA activation and ran a fully charged LiPO 3S (12.6V) into my original ATS-3 with 2N7000s. No problem if you use a tuned antenna or use a Tayloe bridge tuner in Tune mode when adjusting for 1:1 SWR. I don't have an MTR to inspect but I'd be surprised if it would hold my 1100 mAh LiPO (~2 cu in...1X1X2). I also have a 270 mAh which might fit.

I stuffed a 9.6 v 1500 mAh LiFePO4 in a separate Altoids tin and use it for my MTR with good success. And It seems to last forever.

TJ et al -

Fred-KT5X earlier noted that he was doing activations at about 5 mAh per QSO with his AT-S. And Steve-WGoAT has used a 9V battery with his MTR for three activations. So thousands or perhaps even hundreds of mAh capacity should run this MTR radio for a (very), good, long, while.

If I would happen to hold the transistors in my hand needing to replace them, I would take the time and measure them so that they have their R-DS-on closely matched. I use a test rig consisting of a scope and a rectangular pulse generator set to a very low duty cycle to avoid heating (abt 2Hz repetition and 1-10ms on), but g4zfq shows us how to do much easyer:

https://sites.google.com/site/g4zfqradio/matching-bs170-for-softrock

I do not know if the original transistors come matched. Usually if they are of the same batch, the odds are good that they are alike, but as I said, if I would have them in the hand... Bought some 30..50 pcs of BS170 and sorted them to heaps of 3 depending on their R-on value. Most came within 10%, little were below 5% and only a couple came as close as 2%.

Another question would be if it would not make sense to put a small resistor (1..5 Ohm) in the drain of each transistor to help distribute the current more evenly.

I looked with the scope at transistors passing away during pulse when connected in parallel. They do not die during the ON phase, like they would if over-heating, but during the switch-on transient. It's like with horses: the hardworking get the most beating. If paired and having some kind of current distribution, they might carry the load easyer.

Wonder about your oppinion. 73, Razvan DL2ARL

It would be nice to have a definitive answer whether or not a fully charged 3S LiPO battery produces too much voltage for the MTR or ATS.

My thought is with a load, the voltage for 3S LiPOs will not be much above 12V for long. I've always thought that Steve's caution about using more than 12 volts meant don't use a bench supply since it would produce a voltage that would be at 13.6 and never drop.

I've been using 3S LiPOs and chargers purchased from Hobby King to run most of my /p rigs, including the KX1 and the Weber line. I try to use resonant antennas along with a tuner - either an Elecraft T1 or a SOTA type EFHW tuner.

I've always liked this article on batteries:

The reason I wanted to use a lipo battery would be to get a bit more power
at the antenna, with 9 volts, I get about 2.5v. At 11, can get 4 ish

I've been using 3S LiPos for years on all the ATS series, never a problem. I've also used it on an MTR without issue. While that may not be "definitive", it is mine (and others) experience.

I've been using a set of 9 AA's with one dummy cell in a 10 AA pack. Unfortunately, this is a bit of heavy for some of the long treks and I've been exploring other ideas for use with the MTR. I have a buck-boost regulator, but it's size is half that of the whole MTR (too big) and a bit heavy too. I also have a 12v regulator, but for heat sink reasons, can only handle a 3w differential (no go with a 4s and 3s will drop too low).

So, when Fred said some chargers will stop at a predetermined voltage, he got my attention. Fred, do you or anyone else have some links you could post up of different 3s lipo chargers that would work?

"I use a tiny SP switch and diodes to drop the voltage tuning, and intially, but you can program your charger to stop at any voltage you want."

While not many cheap chargers have programmable cell voltage for each chemistry(Pb,LiIo,LiPo,LiFe), they do have the ability to do a 'storage charge' for Lithium batteries which is just about as good. This limits the charge to something like 3.85V/cell (LiPo). Thus for a 3S LiPo you would start off at about 11.5V. Perfect.

The other option is to just use a LiFe battery which is 3.3V/cell and will safely go down to 2.5V/cell or lower.

No need to use diodes or other stuff with either solution.

(Not endorsing it, but one example of a charger is the Turnigy Accucel 6. <https://www.sparkfun.com/datasheets/Prototyping/Batteries/ACCUCEL_manual%282%29.pdf> There are plenty of others, and quality varies of course.)

I think the best answer is to go with LiFe. No need to worry about over voltage, tuning power, or over discharge. I think you'll notice when the battery gets down to 6V, the point at which over-discharge may become an issue.

I bought a dozen used 1100 MAh cell phone batteries from an internet auction site. From that bunch I was able to make 3 3-cell packs, each of which will run my MTR for longer than any outing I can muster. Three of them taped together makes a nice little stack that fits inside the box.

The only aggravation is charging them. I had to make up a little charging fixture from small pieces of PC-board material and then charge each individual cell separately. A real pain, but once charged, they seem to hold a charge forever.

Hi Dale,

I think it's a good thing to give some "builder's advices" since with the new MTR batch there might be a few OM new to the thing.

I assembled mine with an iron, hand soldering, but complementary to yours, there are some advices good for both ways of building :
- take it easy, go slow,
- always ensure you are not too tired and you have good light on the working area,
- use a large box cover with edges when you have to open a bag to sort out parts,
- use small closed boxes (like the one for weekly medication) to store open reels of parts,
- check parts and parts placement twice, and perhaps one more time,
- keep an updated inventory of the parts so you can cross-check any misplacement
- do electrical continuity check after you placed the ICs to track down cold solders as soon as possible

If you have a good sight and steady hands, SMT soldering is not harder than through hole. In fact I found it easier because you don't have to bend the resistor legs, cut them, and the soldering is done on the same side than the part placement.
However, with SMD it is hard to correct a part misplacement (unsoldering is tricky) and troubleshooting is not as easy (you cannot put a part out of the circuit to check what happen or replace it easily). That's the reason you have to go slow and check things twice (and twice more perhaps) before soldering.

Enjoy building!

Gil,

I'm thinking of doing the same thing but you would need to have a bigger panel. The output from solar panels falls off rapidly and when clouds come over, the charger will dump and sit there until you restart it. I was going to take a different approach by charging my Zippy through its balance plug only. Low level current could be fed into each cell individually by 4 cheap 10W panels (mine is 4S) You know the ones that sit on your dash and attempt to charge your car battery. My design consists of 4 of these 10W panels individually feeding four LM-317T's set to 3.6V(or whatever matches your cell chemistry). The grounds are isolated so they wouldn't short out the battery. A bit inefficient but without switching noise of any switch mode regulator.

The coolness factor of this could get really fun by incorporating an Arduino into controlling and monitoring the charge.

Personally, I can't see reason to try to squeek out 2 more watts that a 9 volt pack will give you. If I were to use a or 11.1 volt (nominal) LiPo/Li-Ion pack with 12.8 volts fully charged, I'd use a 1 volt Zener, or a pair of 0.5 volt zeners in series, with a monitor on the battery voltage, and short out the diodes when the voltage got below 12 VDC.

I've run my AT-Sprint (original version), optimized for 9 volts, with an 8 pack of NiMH pack, which has ~ 10.6 volts fully charged, and which drifts down to 9 volts rather quickly. Why optimize of 9 VDC? It's easier on the finals to run at that voltage. The rig will tolerate SWR ~3.0 on an antenna with nary a problem. If I were to run 12 volts or slightly more, I'd endanger the finals, and maybe get ~5 watts out, and I would need to be very careful of the SWR.

Ain't worth it to me.

BTW, in case you've forgotten, I joined several other nutty hams who had a ball running the North American QSO Party with these kinds of rigs last August. We were mostly running ~ 3 watts to various rigs designed by KD1JV. See my article on the subject at
http://www.w8dc.org/grr_images/Greeb2.pdf

That's all I have to say on the subject. To each his own, potato row.

To all three (?) OMs who responded to my plea about "Chrome", thanks for the advice, I did an install, then goofed from the start. I'll have to dump it from my system, reinstall, then find a "readme" file to figure out its tricks. There are pluses and minuses on it, yet as I learn how to use it, I have far fewer problems than with "I.E.", it's a monster, then Firefox tends to crash at times.
What I'll do is be careful of how many browsers I have up and going, then learn how to dump items that sneak in! Eventually, as I get my mess tamed in my shack, I'll get as far away from email and the Internet as is possible, use XP as a control for my Kachina rigs and whatever other rigs that will respond to commands from those "Indians". Perhaps "Chrome" will be of benefit in areas that demand a lot of security, who knows.

All input is very appreciated, now to use time in cleaning up the shack, looking forward to hearing signals from the HF gear again, pursue the installation of my rigs and antennas in the "ranch QTH" before hurricane season.

73's, best to all,

Gil WA5YKK

(We never had messy digital problems on the Internet, now we take a chance on it while trying to tame a rig that can be controlled by these infernal hexadecimal machines!)

BTW - Does anyone have a preference for a "shack speaker"? I've looked in different catalgues, found one that might even work mobile, yet a tiny thing about fist size is nearly full range, takes plenty of watt punishment..... but each one costs from $50 to $100, depending on what you want. Incredible, the advances in speaker tech these days!

For my really, really long hikes, I prefer the disposable Lithiums. I don't always have anywhere to charge batteries in the woods, and carrying the charger is additional weight. I've found those Energizer disposables last forever and are light. I've posted some photos tonight of the six-cell version of the charge that I used in the book, Three Hundred Zeroes.

Photos of battery box and internals can be seen at:
http://groups.yahoo.com/group/AT_Sprint/photos/album/785358388/pic/list
<http://groups.yahoo.com/group/AT_Sprint/photos/album/785358388/pic/list\
>

The battery box is just some thin PC board with copper cut away to form "jumpers" for the batteries to put them in series. To keep tension against the batteries, I used some stiff foam and glued it to the tin. Actually, the foam already had a sticky back.

If there is a really strong desire to add a seventh, or even eighth cell, one might consider just adding it in line. A piece of 3/4" PVC about 2.5 inches long should work. Cut a slot on both sides of the PVC, near both ends, just wide enough to slip a small piece of PC board through the slot, copper facing the battery side. On one end, Super Glue the board in and solder a wire to it. This will be one end of the contact for the battery.

Wrap some thin cardboard or sheet plastic around a AA battery (to take up the extra space) and slip it into the tube. Slide another piece of PC board in the slot at the other end, copper facing the battery, and then stuff enough foam rubber in to force the copper up against the battery. This slot may need to have some "slop" in it to allow the PC board to push against the battery. Put a 3/4 inch PVC cap on the open end, forcing the foam rubber down and put a small screw in to hold the cap on (or drill some holes and put an expansion pin in). Solder a wire to the second PC board.

Alternatively, the second PC board could be filed round to fit inside the PVC and then glue it to the foam and push it down in, with a wire soldered to it.

Eventually, I'll get around to making one and posting a photo if anyone wishes. It ends up looking like a fat inline, fuse holder. There is no reason one couldn't package all the batteries like this, putting two or three to a tube and then tie-wrap, or tape the tubes together for a rugged, reliable battery pack.

One could use springs, but I hate the bloody things. They rust, break and otherwise are unreliable. Flashlights have used springs for almost a century, and we're always "banging" the flashlight to get a good contact. The foam gives a nice, steady, widespread pressure and has served me well in the wilderness. I started out the Appalachian Trail with those cheap, black or white plastic things that use springs, and after a few hundred miles, I had to improvise in the woods. I found some

cardboard and made a holder similar to the PVC tube I described above, and it lasted for almost 2000 miles. I've since gone to the Altoids carrier and it has been fabulous.

I highly recommend "Three Hundred Zeros" for an excellent tutorial on how to do "real" QRP operating while on a looonnnngggg hike.

I'd NOT recommend getting into a situation where one needs "Three Hundred Zeros" to recuperate from a multiple heart bypass operation, but I'm very glad to note that the author managed those zeros quite well!

Note, I don't plan to every hike the entireAppalachian Trail, in one year or in 10segments, one each year, but I truly admire folks who go on such adventures.

I note you have a "Zomboids" package for your power supply. Is that just a decal or similar on an Altoids tin? It lookslike something from qrpme? Is this true?

I believe Steve has answered this question previously. You need to avoid excessive current through the final transistors (2N7000s or the more rugged BS170s). This means you must avoid operating into reactive loads when using >12V. Use either a known resonant antenna or a Tayloe-style bridge tuner which presents a non-inductive load to the transmitter independent of antenna load during TUNE mode. The Hendricks SOTA-tuner and the Emtech ZM-2 both use this type of bridge in TUNE mode.

I'm still on my original set of 2N7000s in my ATS-3 running 12.6V from 3S LiPOs, but I'm always very careful to be sure the antenna is resonant. If I'm concerned at all, I carry a 9V transistor for lengthy TUNEs and then switch to the 3S LiPO.

Another excellent antenna tuner, light weight and more efficient than the Hendriks offering, used by many SOTA and other /p ops is the KI6J End Fed Half Wave antenna tuner which employs the Tayloe bridge for tuning. Find out more here: www.betterqrp.com

Stu, KI6J, has a collection of Balun kits that are lightweight and easy to put together as well.

Steve,

I think you should seriously consider handing the ATS-4B over to
Hendricks. Possibly with all SMP:s pre-mounted on the circuit board.

It is just too a good design being reserved for just the few who
happened to buy one when you released it. For such an ideal portable rig
a price of 300$+ is no problem!

You're correct Hank, that Altoids tin is actually painted with the Zomboids logo by QRPme.com. Rex, W1REX had those mints put together for an event a few years ago. I had the empty tin after using up the mints. I might note that the antenna tuner in the photo of the "station in a box," is also from QRPME.com. It is a standard serial L tuner that Rex has dubbed the "Tuna Tunah," (that's Maine talk for Tuna Tuner).
http://qrpme.com/?p=product&id=TTH <http://qrpme.com/?p=product&id=TTH>
On the AT, I had a homebrewed version of that tuner and it worked well. The QRPME version is an improved version, that has a low-impedance mode that allows it match up with just about any antenna configuration, maybe even a "wet noodle". I'm not, in any way, involved with QRPME.com, I'm just a very happy customer. The Tunah is a bit expensive because it uses real toggle switches and it is just impossible to find that quality of a switch for a reasonable price. You get what you pay for.
A note about KD1JV: Steve has changed the landscape of hiking/QRP forever. His ATS series is beyond compare. I've taken that rig on many LONG hikes and it never fails to amaze me. The batteries last forever, the rig weighs nothing and I never lack for contacts. Hank's previous comments about Three Hundred Zeroes (http://tinyurl.com/2f74mdt) don't capture how important Steve's rig was to my completing the AT hike. I started out the hike with a homebrewed rig that weighed over three pounds. After 600 miles, and a six-artery heart bypass, I took three hundred days off and returned to the trail to finish the hike. During the three hundred day rehabilitation, Steve sent me an old proto-type of his ATS-3A and told me to use it. He figured the three pound rig was the reason I had the heart failure in the first place! Actually, it was genetic, but I digress. The ATS was a game changer for me. Replacing that three pound-plus rig with his, meant I could carry several days more food, not an insignificant change. It also used fewer batteries.
In 2011, Jane, KA1FUN and I hiked the Camino de Santiago, Spain. It was a 500 mile trek. I had the pleasure of using the ATS3A on that trip and had a ball with it. Operating in Europe was fantastic, especially on 40/30M. I used the Lithiums for most of the hike and had to replace them with standard alkalines near the end. I'm still working on the book about that experience. I should have finished by now, but life just has too many distractions.
Speaking of which, Jane and I are leaving for Barcelona, Spain in late April and will be bicycling/hiking all over Europe, for up to six months. We'll be riding in Spain, Portugal, U.K., Belgium, Luxembourg, France, Holland, and possibly, Germany. Once again, the ATS3 will be pressed into service. I'll hang around all the usual QRP watering holes and will post on QRPspots.com, whenever possible. Hopefully, I'll work a few of you from that expedition. I had no trouble working stateside stations from over there, using QRP and a "wet noodle."

Gentlemen - shaping of the transmitted waveform in the CC1 is provided by R42 and C44, and it sounds nice. If you read my blog-post, which was referenced earlier in this thread, you'll see that I was talking about the sidetone and NOT the transmitted signal. The CC1 is still in beta, and softening the leading edge of the sidetone waveform to get rid of the click should be a simple matter.

Apologies for the invasion in your group Steve, but I don't like to see what looks like misinformation being spread. I was sorely tempted to buy one of your MTR's but I have so many projects here (non-ham ones in particular) and only so many hours in the day!

Neat trick! Thanks for the clarification!
So the 74AC08 gates are spending a considerable amount
of time in the transition region. I wouldn't have thought
it would work that well through two levels of gates.
But if it does, it's a very elegant solution.

Steven,

I've been reading through the MTR_2 manual in readiness to put together the MTRs that I will be building.

I think that the section on the 'band select' resistors might be a little confusing for first time builders. In the manual for the first run of MTRs the table of band select resistors also included text explaining which resistor placement did which band ie R3(BS1) for the highest frequency band of choice (20m) and R4 (BS2) for the lowest frequency band of choice (40m).

Best wishes,
Colin, M0CGH

Sorry, but that does NOT shape the transmitted wave form. It simply shifts the turn on/turn off time of the gate a little. If you sync a scope to the keying line and look at the output signal, it will simply turn on and off a few milliseconds after the key is closed or opened. Those two parts could be eliminated with zero effect on the output signal.

The only way to properly shape the output signal with that topology is to ramp the PA supply voltage up and down as I do in all the ATS rigs. I invented that transmitter circuit 10 years ago.

At 2-3 watts, it really isn't a big deal to have key click supression or not, but the signal will have a narrower bandwidth and sound a little better at distance if it does. I opted to add the extra parts to do it right.

As for the sidetone click, he has a lot of filtering on it already, I suspect it has more to do with the muting circuit than anything else. Been down that road a few times.

OM's,

Pardon my wind change (again), I'm on the hunt for a really good speaker(s) for my QTH, got one at AES in my sights, then all but happened to encounter the Cambridge Soundworks models. They all seem to be in the fist-sized size range, and the ones that are made for amplifiers can handle a minimum of 25 watts, give you 150 Hz to 20K Hz range of hearing. Everything is expensive, yet I've tried many brands and models, never have found a "one size fits all" for mobile and QTH use. With the British made models, I can add to them for a computer-controlled music system that will also handle my different rigs that will respond to control programs, this will be fine for both QTH setups.

Any ideas on this, or should I start calling the ham radio outlets and take up "tech time"? The only problem with a dedicated "rig speaker" is that it;s not transportable to a music system, and even I can run out of space for my toys.

Tnx, 73's, spring is here, the Spring Break insanity and drunken madness is gone for the year!

Steve,

You're right. I managed to express my doubts in my last post,
but my opening was perhaps a bit too upbeat.

Amplitude Modulation is generally credited to Fessenden.
I don't think he used logic gates for drive though.

I understand, mostly just an attempt at humor.
Like I said when the CC1 first came up, the influence of your
rigs is clear. Most published designs are a cut and paste
of familiar circuits, that CC1 perhaps a bit less so.
In particular, I hadn't seen that keyclick filter scheme before.
Though I'm being a bit snide there, I sincerely think he's
to be commended for trying.

The low side FET drivers for switching power supplies
and class D amps are getting into HF speeds.
I wonder if they might replace the 74AC and the FET both on
the lower bands. Here's a few, some cost around a dollar.
http://www.ixysic.com/Products/IGBT-MOSFETDvr.htm

I vaguely recall an entire QRP transceiver using only 7404
inverters, each biased into the transition region with a bit
of feedback so they could be used as amplifiers.
Probably a Ham Radio article in the late 70's.
Anybody remember? I don't think it worked very well.
The amazing thing is that it worked at all.

Steve I have a question.
To make the ATS rigs work on lets say 160 to 10 meters what is it that states what frequency you can make the transceiver work at?
Is it a design thing? Or is it the cost of a part or parts? Or both?
Just wondering..... I am just getting back into electronics.
And another thing. I just want to tell you thank you for the wonderfull work you do.
I have a 3A, 3B and a 4 great back pack rigs for trips.
But one other thing. Lets say you are a person with very little room like someone that rents just a room or is in a retirement home. Or a older person that lives with their family. A great rig for them.Not everyone has the room for a K3 with all the bells (Lets keep the code alive)
That said..... build a 160-10 meter rig .....LOL (I herd that :)) HI HI 73

Steve's explained the absence of the upper bands in older posts.
Higher frequencies require a faster oscillator into the DDS
which increases current consumption on all bands.
You could scale the caps and coils to 160 meters, though most
wouldn't find much reason to use that band in a trail rig.
But worth asking him to consider it, he's built lots of different
kinds of rigs.

Could modulate the duty cycle. He already has a comparator
with a sine wave on it up front. Maybe no comparator needed,
just vary the DC bias of a sine wave into the gate.

From: Keith Hamilton
Topic: 10587 Message: 10587

I am in the process of preparing myself to assemble my new MTR kit when it arrives. I plan to do the warming griddle/heat gun technique.

Warming tray..... check
Heat gun with low setting..... check
Solder paste..... check

Also purchased a couple of small projects from Hendricks for practice.

SMD dummy load..... check
SMK-2 ..... check

I was wondering if I got the right solder paste. What do you guys recommend?

I will let the group know how I do!

Topic: 10590 Message: 10590

Hello,

The thread on batteries really got me thingking and searching for a solar solution for my upcoming MTR.. I am thinking of using a 13W flexible solar panel and eight 1.2V NiMH cells for a total of 9.6V.
What would you put between the solar panel and the battery pack?
Circuit or device suggestions?
I have a SunGuard SG-4 and CirKits SCC3 charge controllers but those are 12V output.

Thanks,

Gil.

The rigs would work on 160 meters. There's some complication with having a wide enough passband on the passband filter, and also problems with front end overloading if you live near a 50,000 watt Broadcast Station. Steve, KD1JV, could lettuce no more about that. I suppose you'd have to "tell" the microprocessor which runs the VFO to ascertain that it should generate 1.8 - 2.0 MHz signal, but that's just software.

For "trail" radios, 160 meters isn't very popular, because of the difficulty of getting an effective antenna out of the trail for that band.

For 10 metres there is a "problem" with the frequencies at which the microprocessor runs. A higher frequency processor takes more current, and in a trail radio current consumption is a concern. With the current processor, 15 meters is the highest band possible.

Hope this answers your questions.

I'd appreciate recommendations for a warmer plate that works well for SMD soldering (together with an embossing gun, which I do have).

Is it possible to use a cast iron pan on an electric stove at the lowest setting instead of a warmer plate, assuming an IR thermometer confirms temperature 200-250deg?

Thanks & 72,
Barry N1EU

Yes I understand this. It is a trail radio so on and so forth.
But I was just thinking.... lol how many years will I be able to go up that trail.
Im getting old... so the YL tells me.
And on the 10 meter band would the curent draw be the same on all the other bands and just be higher on the ten meter band?
We all have our gifts. And electronics is not one of mine at the moment. but working at it.
I am just getting back into Ham Radio After 23 years of Navy service.
I was part of a new crew on a brand new ship.
I set up the MARS if I have that spelled correct radio room on my ship spending as much money I could have of the tax payers money on two signal one rigs with all the bells.
I think I spent $25,000 on all the toys
When I got finished putting it in the captain said so more radio room boys. Its gulf war time.

That might be a bit risky. I bought an electric griddle at walmart for $15 one Christmass which does the trick, though it can hold a dozen boards at a time :) It's almost yard sale time and one can often find electric griddles or frying pans there. And don't forget the thrift stores. It shouldn't be hard to turn one up for $5.00.

Well, if I were looking for a good radio to use at home, and on outings like I do, which involvetaking the rig, antenna, and power supply in my van out to a park, where I can sit under a picnic shelter and operate rain or shine, I'd choose either an Elecraft K2 or (if I strike it a bit richer) an Elecraft KX3. The K2 was originally designed and built in the early 1990's, yet it still is being sold. I've used one of them with the 100 watt amp (built in), for several field days, and it works great. It can be had for Between $500 and $800, depending on what bellzandwhistles are inside. The KX3 can be had, bare bones, for around $900, fully loaded probably around $1500 (I haven't priced a "fully loaded" version.

The K2 "bare" runs 10 watts out max, the KX3 runs 15 watts out max. The KX3 is very near the "top of the line" for most receiving specs, and, by now, most of the "bugs" have been worked out of the firmware.

72/73 de n8xx Hg

p.s. I'd love to have a peek at the $25,000 MARS station! :)
p.p.s. I've been around a bit more than 3/4 of a century, been a ham for 61+ years and hope to be pounding brass with my left foot a few more years. :)

If you want something SMALL, light of WEIGHT, and one that does EVERYTHING from DC to Daylight, there is really only one choice.

The Yaesu FT-817.

Some come close, but just fall short by >< that much!

5 watts, all mode, 160m through 70cm (except 220). Power levels at 0.5w, 1w, 2.5w and 5 watts. Typically 325 to 380 MAH receive, depending on how you set it up. Up to 1900 MAH on 5-watt FM transmit.

V/UHF contests are a BLAST when you can carry your station 3000 feet above the average terrain. Do that in a rare grid, and better tale extra log sheets along!

The bigger brother FT-857 and FT-897 run the same bands, but at a higher cost in battery use, both TX and RX.

If you are willing to give up a few bands - there are a few other radios that can then join the list. If you are willing to go with CW only, there are a ton of radios on the list. But there is only one DC-Daylight radio right now.

I understand Gulf War. I was AEM3WT in Al Khobar, until I had to abandon my station to go north into Iraq. At least you got to keep your shack near you, unless the Captain made you-all toss it overboard. <grin>.

Subject: Re: [AT_Sprint] Re: nits and hacks

The rigs would work on 160 meters. There's some complication with having a wide enough passband on the passband filter, and also problems with front end overloading if you live near a 50,000 watt Broadcast Station. Steve, KD1JV, could lettuce no more about that. I suppose you'd have to "tell" the microprocessor which runs the VFO to ascertain that it should generate 1.8 - 2.0 MHz signal, but that's just software.

For "trail" radios, 160 meters isn't very popular, because of the difficulty of getting an effective antenna out of the trail for that band.

For 10 metres there is a "problem" with the frequencies at which the microprocessor runs. A higher frequency processor takes more current, and in a trail radio current consumption is a concern. With the current processor, 15 meters is the highest band possible.

Hope this answers your questions.

Well, it wouldn't hurt my feeling if you bought another type of rig which more closely matched your needs. I understand that only a few use my rigs for thier intended purpose of operating on top of a mountain or out in the woods. Most buy it because it's so darn cute or they like the challenge of building it.

But that's a good thing as that demand makes it possible to produce the rig in the first place so those who do want to carry it long distances or up steep mountains have a rig which they can.

As for operation on 10 meters, there are a few issues. One is current draw. The DDS clock frequency would have to nearly double to at least 75 MHz, which would likely add 50 ma to the base current the rig draws on all bands.

The second issue is my very simple transmitter becomes very touchy at 28 MHz. At 21 it's a little marginal, but workable. 28 is pushing it a bit too close to it's limits.

Thirdly, 10 meters has been pretty much a dead band these days. It never did come alive this sun spot cycle and the next one doesn't look very promising either. Hardly worth the effort or expense to do something for this band.

At the other end of the spectrum, 160 M, there isn't any real technical issues, although the comparitor in the DDS chip used to produce the square waves for the transmitter isn't suppost to work below 3 MHz, however it does. The real issue is one of the physical size of the coils needed in the output filter. The smallest core which will work is a T50 and thats too big for a hand held radio. Even 80 Meters is a difficult band for many to use due the size of the antenna needed. It's twice as bad on 160 so offering that band for a just a hand full of guys isn't worth the effort.

Hi Steve:

Nice response. I figured I remembered your comments correctly from past inquiries.

But, I'm still waiting for that 160/80 meter Direct Conversion rig about which you teased us about a year ago. :) I know you said you ran into a couple of difficulties, but untilyou say it's completely off the "to contemplate" list, I'll wait on pinzandneedles. :)

72/73 de n8xx Hg
QRP >99.44% of the time

p.s. And, I know you never figured any of your rigs would show up on a "full blown" contest, but we're all surprised how well they did in the NAQP CW!

Here's an option I recently came across. It's a miniature switching voltage regulator rated to 3 Amps. I have not yet tested one to check for RFI but plan on doing so in the next week or two. http://www.dimensionengineering.com/products/de-swadj3

I have a Goal Zero 13 solar panel and was told by Goal Zero directly that it's Chain-In port was regulated to 15v max but in fact it puts out close to 21v. I think I'll try the SWADJ3 to bring it down to more radio friendly voltages!

Thanks for the reply steve.... We are all learning as we go along.
And I do have 3 of your rigs. (I love them) I want more!!!!!!
And as for the PS .... I think it was from hank on the mars station.
Was very easy to spend $25,000. Everything has to have a mil spec onboard the ship.
You know a hammer costs $200.
What is realy sad is when you need to move a light socket.
The cost is 1 mil, all becouse all the paper work for the whole ship must be changed for everyone everywhere Shipyard and all the way up to the pope. 73

Dale,

Thanks for that one - I used a similar miniature heat plate called a candle warmer - I found it at Hobby Lobby. They are sold for use with fragrant candles.

I ended up running it on a small variac set to about 140VAC to boost it up a little - I found that when water drops bounced around boiling on it, it was just right. I supported the pcb on a few pennies, so the SMT parts on the underside of the PCB touch nothing.

Whatever you use, don't let the heat get any hotter than what it takes to make little water drops bounce around as they start to boil. If they just sit there, it's not hot enough. If they boil away instantly, it's way too hot. Remember this is just a pre-heater - so you can keep your small hot air tool at a distance and avoid problems from excess heat or airflow.

I also got my embossing tool (low flow hot air tool) at the same store. Guess I got lucky, because I had no problem with SMT parts moving.

What Dale says about taking your time and going slow is the big secret.

When I built my MTR I chickened out and built it with my Weller WTCP Z-series. The hot air does a prettier job if you're good.

Mike,

I actually have an FT-817. It contains an array of amazing technology in one compact package, and it's fun to use. It's incredibly versatile.

However, for backpacking or extended hiking/mountain climbs/etc., carrying that radio and a suitable battery would be like carrying two bricks.

The ATS rigs receive on close to 1/10 the current, they transmit 5W with about 1/3 the current, and they are much smaller and easier to use on CW.
The ATS receiver is better for CW even without a knob, because there is less noise.

On the air they both sound nice.

They're both wonderful radios - depends on what you're doing that day!

I know which one I'll use for the Bumblebees...

I'llbe using the AT-Sprint original version, which works grrrrr8!
Nameplate says it was made in 2003, and it still works like a charm!

I do need to get my AT-Sprint 3b put togetherone of these years, and am anxiously awaiting the arrival of the MTR, so I can get on 80 meters with one of Steve's rigs.

Bruce,

Ditto here.

For those who wonder about this question, I started using 3 18650 lithium ion cells when I got my ATS-3A running, and I don't think I'll ever move away from 3S Li Ion or LIPO.

You wouldn't run a notebook computer on a bunch of one-way AA's, so why would you run a portable radio that way?

My battery is about 2200 maH, and I've never come close to getting low on a 3-day backpack trip with hours of operating. 2200 maH is overkill for day trips, sprints, or SOTA-style operating. 1000 maH is plenty.

These rigs can handle the 12.6V of three fully charged lithium cells IF the RF load is very close to 50 ohms. Use a tuner with an LED bridge, tune up on low voltage - I use a dropping resistor, and always match to 50 ohms. Resonance of the antenna is not really relevant, as long as you match it to 50 ohms with a tuner.

It's educational to watch the DC current draw from an ATS rig on the bench as you adjust the match with a tuner. Moderate changes in the load match can cause the DC current to vary considerably. If you don't plan to use a tuner and adjust for a good match every time, I'd suggest running on no more than 9 or 10 volts.

Agreed - as I clearly stated. If you are willing to put limits to it, there are any number of great radios that can go on that list. But only 1 does all mode 160m-70cm.

You can toss your big battery, put in one of the 3600 MAH Li-Po batteries, the FT-817 loves it, goes 5+ hours on a single charge. I love it, only way to go with the 817 now.

Mike - KD9KC.

Mike,

I actually have an FT-817. It contains an array of amazing technology in one compact package, and it's fun to use. It's incredibly versatile.

However, for backpacking or extended hiking/mountain climbs/etc., carrying that radio and a suitable battery would be like carrying two bricks.

The ATS rigs receive on close to 1/10 the current, they transmit 5W with about 1/3 the current, and they are much smaller and easier to use on CW. The ATS receiver is better for CW even without a knob, because there is less noise.

On the air they both sound nice.

They're both wonderful radios - depends on what you're doing that day!

I know which one I'll use for the Bumblebees...

I don't know how on-topic the battery discussion is for this group, but I'm going to chime in a last time because I think I can help avoid a lot of disappointment.

When considering solar charging, you have to remember that a solar panel is a dynamic power source. They do not behave anything at all like what you would drive a typical regulator with. Each model of panel has a unique V/I curve where the panel delivers the most power. Solar regulators or 'charge controllers' can follow this curve by a method called Max Power Point Tracking (MPPT). PWM controllers can also achieve respectable efficiency and are often used with small panels, but MPPT is usually considered the 'best'. Another issue is that you need to match the controller to the battery chemistry. You cannot do this with a simple regulator, and it can in fact be dangerous, especially with Lithium chemistries. (Even a small Lithium battery can produce a somewhat impressive amount of fire and smoke, and of course you *dont* put them out with water...) And finally, you also need to match the solar panel with the charge controller. These systems need to be somewhat engineered.

About the only solution for solar charging LiPos that I've seen *actually completed* is this one from Michael Wolf: <http://www.mictronics.de/projects/solar-cell-mppt/ <I don't know how on-topic the battery discussion is for this group, but I'm going to chime in a last time. This chip (and others like it) have their own requirements and must be setup carefully for their power source and battery in use. And if that's not enough, even when using a solution such as this you still have to consider that Li batteries will need to be balance charged periodically for maximum life and to prevent damage. I'm afraid there's no simple, easy, toss it together solution, although I'd be happy to see

one [:)]

Interesting!!!

PLEASE - report back on this. I have a 40-watt folding panel, and I was looking for a solution to bringing the voltage down to a lower level for the battery charger. But it needed to be small and elegant, not a big and heavy solution.

I have the sun-guard 4, but it must have a 12-v battery attached to it before connecting the panel. Weird, but true.

Thanks!

Luke,

I assume this is the data sheet for your solar panel:
http://www.goalzero.com/creative/assets/guides/Nomad13.pdf
Looks like they have some electronics inside to regulate to
5 and 12v, and that the "12v" output should be between 13 and 15v
when drawing between 0 and 1 Amp. You measured 21 volts there at
0 amps, perhaps the 12v regulator on yours is faulty?
An open circuit voltage of 21 volts is about right for a raw
panel designed to work with a 12v battery.

For occasional field use with such a small panel, I'd probably
just hook the panel directly to a 12 volt lead acid battery,
perhaps from a motorcycle or riding lawnmower.
Regardless of battery voltage, that 13 Watt panel will only
put out a constant Amp or so, limited by the number of photons
available to free roughly the same number of electrons.
Check the battery occasionally with a voltmeter, or add a
linear voltage regulator set to 14 volts or so, to replace
the one that was supposed to be inside your panel assembly.

As Paul points out, LiPo's can fail catastrophically.
Especially at high charge rates. If one in a stack is failing
with a low voltage, the others will be getting overcharged
unless the charger is sophisticated enough to deal with that.
I have charged stacks of LiPo's with a single carefully set
voltage regulator across the stack, but at a current of C/10.
So a 2 Amp-Hour battery might be charged at 0.2 Amps with
such a simple charger. A much better bet would be a well
designed charger specifically for LiPo's.

Check out the solar panel graph on the left side of page 2:
http://www.sunelec.com/Specs/STP240Wde.pdf
The flat lines show constant current, regardless of load voltage.
The lines that peak show the power available from those
currents and voltages.

The MPPT chargers I'm aware of cost several hundred dollars.
Assuming a maximum power point of 18 volts from the panel,
a linear regulator into a 12v battery would be losing around
100% * (18-12)/18 = 33% of available power. And MPPT's
typically lose 10% or so. And charging voltages are often
14 or 15 volts. So just use a linear voltage regulator.
If it draws too much current for the available sunlight,
the panel voltage will drop until the current is just right.

This is an excellent reminder, George. One that I failed to mention in my post.

Though it has been discussed here several times, there are always those who either weren't here for that discussion, or don't search the archives. It bears repeating. The ATS series and the MTS will handle 12.6V IF, the antenna is well matched at 50 ohms. George uses a resistor in line with the battery while adjusting his antenna matching unit, to limit the radio's current draw. I use a resistive SWR bridge in the tuner, that limits the actual impedance swings that the radio "feels" while tuning. Both accomplish the same thing.

Thanks, George.

Yes, support the board off the plate. This is what allows you to do one side, then the other. Remember, you are only pre-warming the board. The embossing tool does the actual solder melting.

A little misleading, it's only rated for 3 amps at 8v oupt and below. If you want a higher output voltage (and you do), count on only 2 amps or so. Also, it is difficult to predict how regulators like this will behave as the sun goes behind a cloud and then returns, etc. The best way to use a solar panel (IMO) is with a charge controller feeding an external battery, then to the KX3. The solar panel keeps the battery charged, and the battery acts as something of an ouput filter for the panel/charge controller.

I would not connect the output of this (or any solar/switch-mode regulator) directly to the DC input jack of the KX3 without an external battery to stabilize the voltage.

Sorry, morning pre-caffeine confusion. I mentioned the KX3, as I was also reading in that group on this topic as well. My advice is also applicable to the ATS rigs. I wouldn't trust the output of the switchmode regulator to be stable enough, without the connectuion to a battery to help stabilize it. Back to the coffee pot!

Hello Luke,

That's the panel I plan on getting.. I might try that regulator too, to
charge a 9.6V battery pack..

Gil.

Guys,

I am looking at the GoalZero Escape 30 briefcase. Do you know if it has an internal regulator or is it raw voltage from the solar panels out to the whacky 4.7mm plug. Me thinks it raw unfiltered, unregulated voltage direct from the panels but wanted to ask someone. I plan to use that with my AnyVolt3 (when that comes in).

Thanks. Could the regulator simply be used to take the 20V or so from
the panel down to say 15 or less to feed a LiPo charger?

Gil.

Jerry,

Check out this MPPT charge controller from Genasun. They make a small one for SLA or LiFePO4 batteries.

http://genasun.com/all-products/solar-charge-controllers/for-lead/gv-4-pb-4a-solar-charge-controller/

Also have a look at Buddypole controller. I'm doubtful that this is an MPPT controller.

I've had best results by setting the temperature, and once set, leave it at that temp. The board is supported off the surface with pennies, on either side. IF you can't have patience, with the preheating, damage to the board will occur, which will lead to a shortening of longevity, and usefulness of the radio. A few extra minutes in pre-heat and soldering time is a good investment, over the time that the radio is intended to be used. KX0R uses the beaded water bouncing on the surface, and that is a perfect and inexpensive way to set the temp. IF you can't wait for the water to skitter across the surface, purchase of an infrared instant reading thermometer is recommended.

Have a great day,

That guy is using about twice as much solder paste as required. When the joint is done the surface should be concave, not looking like a bubble.

Myron,

That Buddypole thingie doesn't have much of a description,
I'd want to know more before giving them my money.
They say it works with 4 cells of Lithium Ion, which is one
too many for the MTR. Controlling 75 watts with such a small
package means it's almost certainly PWM, could be either
series or shunt topology. Both are common. A series PWM
charger rapidly turns on a switch to send power to the
battery, with a duty cycle determined by the battery voltage.
A shunt PWM charger does the same, except that the switch
shorts out the panel. If you can dissipate the heat, a
linear voltage regulator would work just as well.

If you're sold on the extra efficiency of MPPT, the Genasun
looks like a good bet. And they have a model tailored for
3 cell Lithium Ion batteries at $115. I would assume
that means it starts charging a discharged battery pack
with low current till it reaches some minimum voltage, then
a bulk charge at high current to a specific ending voltage.
That ending voltage can vary across specific Lithium battery
chemistries, make sure Genasum and your battery maker agree
on that final voltage.

It does not monitor individual cell voltages or temperatures.
Some Lithium Ion cells and most battery packs include
protection to do this for you.
From http://en.wikipedia.org/wiki/Lithium-ion_battery:
"If overheated or overcharged, Li-ion batteries may suffer
thermal runaway and cell rupture. In extreme cases this can
lead to combustion. Deep discharge may short-circuit the cell,
in which case recharging would be unsafe.[citation needed]
To reduce these risks, Lithium-ion battery packs contain
fail-safe circuitry that shuts down the battery when its
voltage is outside the safe range of 3□4.2 V per cell."

Lithium-ion polymer is similar:
http://en.wikipedia.org/wiki/Lithium-ion_polymer_battery

If you have the time, charging Lithium Ion's up to a specific
voltage with a maxumum current of C/10 as described in my last
post is safe and simple. Works for NiMh and NiCad's as
well, many consumer products (portable radios especially) have
NiMh batteries with a C/10 charger and a timer circuit set for
15 to 20 hours. The NiMh and NiCads use the timer because
there is no easy way to detect the charge endpoint, whereas

with Lithium Ion and lead acid you can terminate at a specific voltage. (The fast chargers for NiMh/NiCad detect a rise in temperature or look for a minor dip in voltage to see end of charge, you can't just hold it to an ending voltage like you can for Lithium Ion and lead acid.)

That C/10 recommendation is pretty conservative. If you are not risk averse, put on your safety goggles and scour the web for information on Lithium Ion charging algorithms.
As stated above, my guess is that the Buddypole product is charging lithium ion cells with no algorithm other than simple voltage regulation. They have one product, good for lead acid or lithium ion.

Lithium Ion's the best bet if you hope to use your batteries in sub freezing temperatures. The model airplane guys (and Boeing) often charge and/or discharge them in 10 minutes at something like C*10 or more (charging is not 100% efficient, especially at those rates). And they have the highest energy density by weight of any commonly available battery. That might help explain the reputation for blowing up in a nasty lithium fueled fire.

Here's a $14 1W solar panel, often on sale for less.
With a linear voltage regulator it would be suitable for a 100ma charge into 3 Lithium Ion cells. Kind of bulky, but might be a good choice for a $100 transceiver that's usually pulling just 30 ma. I have several of the older red ones. As always with HF, your mileage may vary.
http://www.harborfreight.com/15-watt-solar-battery-charger-68692.html

With the HF, you're stuck packing mostly glass. Would be nice to find something similar in a cheap roll-up panel.

If it was MPPT, that would be the lead story. In big print.
With the usual overly optimistic "best case" efficiency
figures.

MPPT really starts making sense when the panel is putting out
30 volts or more and you are trying to charge a 12v battery.

Just reading the specs, one can see it has no internal regulator:

INPUTS
Rated Wattage:
30W
Cell Type:
Mono-crystalline
Open-Circuit Voltage:
18-20V
Converting Efficiency:
17-18%
Output
12V Charging Port (4.7mm)
14-16V, 2.0A max (30W), not regulated

Bruce,

If that's for the same panel as the one I pointed to
http://www.goalzero.com/creative/assets/guides/Nomad13.pdf
then they have slightly conflicting specs.
Mine says: 12V DC output 13-15V, 0-1A (13W max), not regulated
and also, somewhere else: Open Circuit Voltage: 18-20V
My assumption was that the 12V DC output was at least partially
regulated to a max of 15V, 16V in your case, even with zero
current draw. And that there was some other output for the raw
panel voltage where one might see up to 20V.
An equally plausible explanation is that the specs are bunk.

The only straight key I own, and the only straight key that Iplan to use with any rig, is my trusty J-38 Military Surplus, WW-II. I had one from 1951 when I was first licensed, until one Field Day in the 90's when it didn't come back with me and no one ever claimed finding it in their junk boxes. In 2005 or so I got a burr up my saddle to send code with my left foot again, looked around e-Bay, bid on a J-38, and won. It came in original packaging!

I still can win Left Foot Contests with the thing.

Hi, Jerry.
The text I quoted was from Goal Zero's spec sheet PDF from the website. The "instruction sheet" you link to below, does seem to _imply_ that there may be a clamp on the DC output, limiting it to 15v. But, I would assume it doesn't, and plan to use it as if unregulated. Or, find someone who has one, and ask them to measure the unloaded output voltage in full sun...

With all the hoopla about getting a new MTR to build with regards to the tools to use, I'd be interested in what kind of small and light weight keys will be used out there. Homebrew? Commercially made?

I built this paddle: www.amqrp.org/projects/paddle/NB6M Paddles.html
It fits inside of an Altoids tin to protect it. I glued a piece of sheet magnet on the bottom so that it sticks to the top of the altoids tin when in use. Works great.

I'll probably use my Palm Mini Paddle like I do with my first run MTR.

I could also use the home brew paper clip paddle I guess :-)

I guess the bottom line for me is can the Escape 30 be attached to the input of an AnyVolt3 (after some rewiring or plug mods) to charge a 12V SLA to some degree? I say "some degree" because there is not the added efficiency of an MPPT controller and I'd probably choose 13.8-14.0 Volts output to float my SLA. I'll probably go with Anderson PP through out the system.

The next thing is how noisy is the AnyVolt3? Anybody use this out in the field next to an antenna?

The AnyVolt3 is not going to do much good on a PV panel.
It needs to monitor the input voltage as well, and keep that
up in the region of maximum power for that panel. Otherwise
it's no better than a linear regulator, and probably worse.

Regarding that $14 HF panel:

The red HF panels I got were designed for a 12v lead acid battery.
This new one claims to be good for a 12v or 24v battery. No
switch, so might waste more power than my red one on a 12v load.
Many of the reviews talk about how it warps into a pretzel when
left in the dash. Cool if true, means it's built all of
lightweight plastic. The boilerplate in the manual is quite
amusing. Suggests you hire a qualified electrician if doing a
grid tie. And how big a wire you need to carry 200 Amps. Nothing
informative, like weight, Vmp or Voc (max power, open circuit).

One thing to remember is that you really need paddles with Steve's rigs rather than a straight key.

If you use a straight key then a lot of the features are not available.

Perhaps another question might be, why would you want it to work? Why not use a proper charge controller which at that amperage would cost less than half as much as the anyvolt?

See if you can find the Micro M+ charge controller kit.

I don't understand why you want a solar collector at all, though. The MTR uses so little current, that a 3 oz LiPO will power it for about three hours of continuous operation. An 8 oz LiPO will power it for 24 hours of operation EZ.

Myron,

The AV3 is a fairly standard buck-boost switching power supply.
It can efficiently convert a higher voltage to a lower voltage
(and vice versa), trading volts for amps by making use of the
flywheel effect an inductor has on current flow. But it is
concerned only with regulating the output voltage.

Assume you put a 15 watt panel on the input and
a car battery discharged to 11 volts on the output.
The power supply will try to give as much current
as needed to bring the output up to 14 volts.
The panel can't supply that much current, so the voltage
from the panel into the power supply will drop until the
current is down around the amp that the panel can manage.
And voltage into the battery will be something a little over
that 11 volts you started with, slowly building up over time.
You'd be just as well off tying the panel directly to the battery,
and disconnecting when the battery reaches a charged state.
Or using a linear regulator, or it's chopper cousin the
PWM regulator. A PWM regulator does not have an inductor, so
does not have the efficiency of the AV3 switcher (or an MPPT
charge controller) in converting a higher voltage to a
lower voltage.

If the AV3 had an adjustment for maximum current (it does not),
you'd find as you fiddled with that knob that there's a setting
for which the current into the battery peaked, at somewhat
more current than you got just connecting the panel to the battery.
But when the sun angle changes a bit and not as much light
strikes the panel, you'd have to find that setting again.
So you sit there with a voltmeter on the panel, continuously
adjusting that maximum current knob, trying to keep the panel
voltage somewhere near the Maximum Power Point for that panel.
On panels built to charge a 12v battery through a PWM charge
controller, that is typically around 18 volts. There are
voltage losses through wires and charge controllers, and lead
acid batteries occasionally should have an equalization voltage
of 15 volts or so to reduce sulfate films on the plates, hence
the extra 6 volts beyond what you might expect. An MPPT charge
controller handles that current limit knob for you automatically,
keeping the panel voltage up around 18 volts. In fact it
automatically finds that special voltage (of 18 volts in my
example) at which it gets maximum power from the panel,
by constantly adjusting the current into the battery in
search of the panels maximum power point.

Way more than you wanted to know, I'm sure.

> I don't understand why you want a solar collector at all, though.

Fred,

May not make too much sense on a days outing, but would if out
for a month. Especially if you have other stuff using
batteries. And some people just like to understand stuff.

That sentence above is not quite right.
What the MPPT does is figure out a panel voltage that gives max power
(typically around 18 volts on these panels), and then varies
the output current to try to maintain that input desired voltage.

The AV3 can't do that, all it looks at is the output voltage.

"I don't understand why you want a solar collector at all, though": Because not everybody returns to their cozy shack to recharge their batteries after every outing, or because your standard plug-in charge controller is rendered useless if the next natural disaster or military attack knocks the power grid offline for any significant amount of time, or maybe I just think it's fun to use a natural, inexpensive and virtually endless power supply to run my toys...

That "Micro M+" charge controller is a really good steer.
http://www.repeater-builder.com/backup-power/pdfs/the-micro-m-plus-charge-controller.pdf

I'd call it a series PWM charge controller, except it takes
seconds to cycle, so virtually no radio hash.
Unfortunately the SunlightEnergySystems website where the kits
are sold is down just now, I sent email to ask if that's
long term.

If there was a spare pin on the MSP430, could implement it
with little more than a NDT2955 PFET pass transistor like the
one Steve uses to key the rig. If the MSP430 senses the
battery voltage is low, it turns on the PFET to send power
from the panel to the battery for however long it takes
for the voltage to rise up to the "fully charged" level.
Then the MSP430 turns the PFET off for 4 seconds
before inspecting the voltage again. Need a small panel,
sized for the desired battery charge current. And should have
some fail safe way to shut down the PFET if the code in the
MSP430 runs off the rails.

As always, not necessarily a good idea.
But fun to think about.

Well, that all depends on your point of view... I didn't look at the eHam listing for the 3b but... If it's asssembled, and in a case, and so is the encoder, then it's a fair price. Let's see- to build the ATS-3b with all the band modules and then build the encoder board and mount both in case(s) would probably take at least 10 hours. For some folks this would be double or triple that time. That includes case construction time.

I forget how much the 3b kit was... $130 or so, if memory serves, and another $30 for the encoder. If the minimum 10 hours for assembly is used, that comes to.. wait for it... $9.00 per hour to build. Less if you take longer.

So, on the face of it, I'd say it's a very reasonable price, no?

Thanks Jerry, I'm just starting to understand this a bit more everyday now. Yeah, the general current consumption of QRP rigs these days is so small that any battery of any size will work for weeks! I wanted to just understand why an MPPT controller is better, now I know. I have seen some MPPT controllers for as little as $65 but I'm sure that Morningstar has some less expensive, or at least non-MPPT controllers.

Thanks again.

I use the American Morse DCP paddle mounted on a Rock-Mite/Mity-Box, so my paddle is a spare radio!

Add my vote to American Morse Equipment.
When I asked the same question a little less than a year ago, my short list was between the Te Ne Ke and one of the AME.
The TeNeKe seemed great but I was worried by the two springs being exposed while I leave the paddle into my bag.
Finally the AME paddles seemed sturdier and easier to fix in case something got broken.

I bought one Dirt Cheap Paddle and assembled it.
It is a very fine piece of equipment and if you give it a little finishing, very good looking too. It can send comfortably up to 20wpm which is my speed anyway.
Its design is simple, but well thought. Nothing comparable to a "desk paddle", but like for the ATS/MTR it was not designed for this.
I can send with the right hand while the left hand keep it still on the table. I will not do contesting like this but as the ATS/MTR have keyer memories, you are not obliged to send all the exchanges "by hand".
I recommend it, I think the price/quality ratio is unbeatable.
The PortaPaddle is an improvement of course, but for me the budget was important...

One last question and I'll be done.

If I have a panel that cannot source the current requirement of the load, the MPPT configuration is the way to go. If however I have a large array that can source more than the load draws pretty much any regulator can work right? PWM higher efficiency, linear no RFI.

Is there a website that covers all of the basics of charge controllers and is comprehensive enough to satisfy the EE in me.

Thanks,

The Truth about eBay ... The price of a sale is a dollar over what the second person is willing to pay.

So ... let's say there is a person who is desparate for one of these little radios and is willing to pay $275 for one. There is a second person who is willing to pay $249, so it sells for $250.

That does not mean 100 of them could be sold for that price. ONE of them can be sold for that price IF no other is available. To see what the 100th might sell for, you have to look at the tenth or twentieth lowest bidder.

Inspired by Fred/KT5X's homebrew teneke ...I'll be using a variation of his wood design teneke or as goats and I call it the SOTApaddle made from a found piece of deadwood near timberline from a recent SOTA adventure.

https://plus.google.com/photos/112295522990729632882/albums/5856052077039686609/5856052137630788114?banner=pwa

Also working on a touch-keyer design but unsure if I can unlearn keeping my digits away from the paddles until I send ...my old habit of resting my thumb near the dit-paddle may be a show stopper on that design? donno?

I think a touch paddle is definitely the way to go for ultimate lightness.
But, yes, the problem is whether or not you can adapt to it. I've
considered building a touch paddle into my ATS3b, but haven't done it yet -
I've got the board and tossed it together with a couple of pads inside a
small cardboard box (think 35mm film box if you remember those!) - not
sturdy, but I'm pretty sure it weighs less than an ounce! See photo on
this page: http://www.aa4ga.com/2012/05/spartan-sprint-may-2012.html

10665. MTR report

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-26 14:25:39 UTC
From: cloud runner
Topic: 10665 Message: 10665

measurements made with the QRP-O-Meter ...

10 volts = 4.0 watts out

10.5 volts = 5.0 watts out

12.4 volts = 5.75 watts out

I use a 500 mAH LiPO battery that will power the radio for about three hours. This battery weighs less than two ounces. I also have a 1,000 mAH battery which weighs about 3 ounces and would power the radio about five hours, and a 2.2 AH LiPO that weighs 8 ounces and which would power the radio for something like 12 hours of continuous use with a lot of transmitting.

I have two sub-mini toggles between the battery and the radio. one introduces a single diode and point seven volts drop and the other introduces three diodes in series or 2.1 volt drop. Together can get 2.8 volt drop, or into the nine volt range.

The battery fully charged produces 12.4 volts, but quickly drops to 11.6 volts where it is flat for a long time.

So ... I can keep the voltage below 10 volts for tuning up. And clearly, there is no reason to run the voltage any higher than 10.5 or 11 volts for full output.

I'll have this radio on a SOTA peak later today, 2000z on 14.061 using the call sign WS-zero-TA, WS0TA/

I should also mention that I've used a commercial electronic touchkeyer with the KX3 in the field and even with 4W RF got into both keyers I tried and messed things up.

My antenna was a PAR 40/20/10 EFHW at the time....not sure if that caused the problem but I wonder if others have used an electronic touchkeyer in the field successfully and what kind of antenna was used??

Great Scott! please do tell us what you're using

73, W0EA
TJ

QRP ARCI #14612 | CW Ops #953 | SKCC #4593T
NAQCC #3768 | Flying Pigs QRP #2254
Elecraft KX3 SN 288
Because QRO is too easy

But I have told you ... it is a homebrew version of the micro-te-ne-ke.

Here is a photo of three paddles. The one at the bottom is the original micro-te-ne-ke and it weighs about four grams. The one in the middle I made and weighs about five grams, including the mount (which is a piece of metal with a nut epoxied on. This lets me mount it on the perfboard clipboard as seen here. The upper one is a more elegant version using cocobolo wood with the wiring imbedded inside having routed out grooves for the wires with a dremel tool. It uses the same connectors as the Palm, but reinforced with a drop of epoxy.

yes, I had to make, not buy, everything, but isn't that what QRP is about?

I have my MTR mounted on the back of a 4 x 6 piece of perfboard. The perfboard recesses the vulnerable switches and supports paddle, clock, log sheet (3x5 card), and battery such that everything is pre-wired, set to go, in my left hand while either sending or logging with my right.

now ...

The perfboard clipboard, MTR, battery for three hours of operation, log, tethered space pen, 24 hr gmt clock, voltage controlling switches, LiPO powered amplified speaker, all taken together weigh ten ounces. My 21 foot carbon fiber mast weighs 7 ounces, collapse to 26 inches. The 20M EFHW wire, tuner, six feet of RG174 weighs five ounces, for a total 22 ounce carry.

10673. EFHW tuner

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-26 15:14:27 UTC
From: cloud runner
Topic: 10673 Message: 10673
Attachments: 1 described; binary payloads are missing from this source WARC

This is a homebrew version of the EFHW matching device used by PAR. It isn't all wine and roses. I find that changing the height of the end of the inverted-L as little as one foot changes the resultant tune from 1.08:1 to 1.3:1, for example. Also, the carbon fiber pole changes the apparent length of the wire compared to a fiberglass pole (by about a foot). Mike, KE5AKL, and Steve, WG0AT have both experimented successfully with a pre-tuned, fixed UNUN. I have nothing new to offer. I followed what I saw on the web.

But here is a less than one ounce UNUN with 6 feet of RG174 to go to the MTR which is hand-held, standing or sitting, a photo of which was included previously.

I'll have to weigh mine - as I recall, it was in the .15 ounce neighborhood - and that's with an enclosure and cable. By building it into the radio's case it would weigh even less. See KC7FYS' version at http://www.flickr.com/photos/jonathancharles/2291295848/in/photostream/

If I were to build the keyer into the rig, I would put one pad on either side of a corner and not add all the solder Jonathan did...it would be super light, and mechanically more rugged with no moving parts, and you wouldn't have a cable to worry about breaking, and it would be a more natural keying motion for me.

Using the kit at http://www.cwtouchkeyer.com/P3W.htm is the easy way - you could save some weight and size by going homebrew with SMT if you really wanted to go small and light. As far as the power requirement goes, it's laughable at 2mA.

I mimicked what I found on the web, and recommend that you experiment with the original rather than my clumsy exploration!

http://www.hamradio.me/antennas/lnr-precision-ef-102040mkii-examination.html

But I will tell you that since my core is different, I put a 4.7K resistor on for a dummy load, and varied the cap. The original design used a much different core and a 150 pf cap. In mine I found 90 pf worked better.

10680. Re: Solar charging for MTR.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-26 15:56:29 UTC
From: jgaffke
Topic: 10590 Message: 10680

Myron,

I wouldn't worry about MPPT unless the voltage at which
the panel gives maximum power is much higher than
the battery voltage. When going from 18 to 12 (typical)
the expense and complication is probably not worth the
upgrade from PWM/Linear.

The Micro M+ is a good choice for a ~12v PWM battery charger on
panels anywhere between 0 and 4 Amps, it wastes virtually
nothing to power itself. None of the heat of Linear, and
slow enough that it doesn't have the RF hash typical of PWM.
Mike says he'll probably have more kits by the end of April.
Read the article I pointed to and then without pestering Mike
too much (it's a hobby!) see if his website's up for kits:
http://www.sunlightenergysystems.com

If the panel cannot source the current requirement of the load,
you probably need a battery in there somewhere.
If by load you mean charging a battery, then what you really
need is time for the voltage in the battery to build up.

None of the solar panel battery chargers I've seen
do current limiting, including the 80 Amp MPPT jobs
costing the better part of $1K. If you put on enough panel
to exceed the Amp rating of the charger (be it PWM or MPPT)
you risk burning out the charger. You also want to make
sure you don't have too many panels for your battery, they
have a maximum charge rate in Amps as well.

The assumption has always been you would be starved for panels
at $5/watt. With some panels going for $0.50/watt on sunelec.com,
it might be time for them to rethink. Would be trivial to add
current sensing. I'd prefer extra panels, so I can avoid a
generator through iffy weeks. And a water heater dump load.

Excuse my punditry, head's been overflowing with this for months.
I'm in the process of moving to an off grid house in the wilds
of far NE Oregon, 2 hours from the nearest stoplight.

I can't recommend one central information source, figured out
what I have by scouring the web. And we know random sites on
the web are always right.

Yeah, the general current consumption of QRP rigs these days is so small that any battery of any size will work for weeks! I wanted to just understand why an MPPT controller is better, now I know. I have seen some MPPT controllers for as little as $65 but I'm sure that Morningstar has some less expensive, or at least non-MPPT controllers.

Hi Fred -

Thanks for the information. Looking at the picture in your previous message, I am confused. It looks like there is a red wire that shorts out the capacitor. Also the capacitor seems to have one end connected to where the halfwave wire would be connected, quite different from the web reference you give detailing LNR design. What am I not understanding?

Yes, sorry, I sent you an early experiment photo. That is actually an AA5TB matcher with a fixed cap.

here is the photo of the set up that worked the best in that it is broader, more forgiving of differences in deployment (though both approaches were sensitive to such things as height of the end of the inverted L wire).

to be precise ... the antenna high impedance side is 28 turns on a FT50-43 core. The primary is three turns bifilar (green windings) with a 90 pf mica across it, across the RG174. I used a 4.7K resistor for a dummy, and varied the cap from 20 pf to 150 pf, and picked what seemed to be the best. THEN, I cut the wire for length that delivered 1.0:1 SWR with this matcher, in other wrods, cut the wire to deliver close to 4.7K impedance at the end ;-)

Don't forget the cost of the consumables. The filament that it uses to
build the object with is not cheap.

--- In AT_Sprint@yahoogroups.com, WVÃ□H <s9plus@...> wrote:
> PWM higher efficiency

Oh, wrong on that count too.

PWM and linear give the same efficiency from a solar panel.
If the battery voltage is low, they both just turn on and
dump all available current from the panel into the battery,
dragging the panel voltage down to that of the battery.
With the lower panel voltage, the volts*amps from the panel
is not delivering as much power as the panel could with MPPT.

When the battery is nearly full, the linear limits the voltage
by dissipating power in the pass transistor. The PWM sends
pulses of all available current from the panel to the battery
with the duty cycle adjusted to regulate the battery voltage.
When PWM is not sending current to the battery that extra power
is winding as heat in the panel. But the panel's relatively
big, and only 10-15% efficient to begin with.

MPPT adds an inductor, so it can efficiently convert all
volts*amps from the panel down to the voltage the battery
actually needs. Like your AV3 switcher, except the MPPT
also has to keep the panel voltage up where the panel can
deliver its maximum power. PWM does not have that inductor.

> linear no RFI.

Yup. Though the Micro M+ should do just fine on that score
since it switches so slowly. The relatively long pulses of
current into the battery might work the battery a bit harder,
and the battery voltage might vary a bit more. But that's
easier to deal with than the RF hash from most PWM chargers.

Fred ...

Your matcher sounds like a well thought-out project. I understand from your posts: The core is FT50-43, 3T on the primary, 28T on the secondary, bifilar winding, and a 90pf capacitor across the primary.

If you don't mind fielding further questions, here are a few more:

(1) Is it for 20M?
(2) When you got done pruning the wire, how much longer (or shorter) was it than the standard length?
(3) I think you said something about a counterpoise. How long? (0.05 wave-length?)
(4) Given that it is not the resonant style of matcher, will the circuit work over a wide enough range of conditions, such that a person could tune it at home and then use it on the trail without a SWR indicator with the MTR?
(5) Assuming a tuned half-wave wire, will it work on 30M and 40M with respectable SWR?
(6) What gauge wire did you use on the primary and secondary?
(7) Any thoughts or measurements regarding efficiency?

The above info will be very useful, as I am leaning toward giving it a try.

Thanks ... Reed K7FLY

Please understand, I am not an engineer, and this is a work in progress. KE5AKL, WG0AT, and I are all playing with one form or another of no tune matching devices for the end-fed wires.

The one I built, a miniature version similar to the 100 watt device once sold by PAR, maybe still, and also sold in QRP version by I think LNR, mine is what I have on hand so not identical at all, is suppose to work with end-fed halfwaves from 15 through 40 meters. I have only tried mine so far on 20 meters.

No, I have never used any counterpoise with any endfed halfwave. I think that you can get away without them at QRP power levels. Anyway, I have experimented with counter poises of variouslengths, and not was carrying any current.

While I have found it to detune when I change the height of the end of the wire above ground, it usually stays under 1.5:1.

It is said that the varicon tuning capacitor used in some tuners are very inefficient when used in the high impedance end of the transformer.

I use 24 gauge teflon insulated wire.

Today, i activated a SOTA peak with this set up. I ran the MTR at 11 volts which produces 5 watts out for me. The transistors ran cool to the touch, so the matcher must have been doing its job. Signal reports were very good, many S-7 to S-9.

Incidentally, the MTR produced 40 QSO's on the SOTA today, for an average of 3.4 mAH per QSO

Two words.... NORTH KOREA! <grin>. They are going to destroy us, dont ya know..... just watch the news.

I have been on camping trips where there was no convenient way to charge anything. A good solar panel and some other parts, and you can get by for several days easy. In fact, I sometimes connect a 10-watt panel to the battery of my jeep, I do not drive it very often and it keeps the battery up.

I have a 40-watt thin-flexible panel that folds up to the size of a notebook. Weighs 3 pounds, not bad, but still heavy for a single day's outing. A spare battery or three is far lighter than the panel. Even a spare battery for the FT-817 is still lighter.

Talk about weight..... a funny story.... I was camping up in the Gila Wilderness. Parts of it really are wilderness. Me, my wife, one Great Dane, and my son who just returned from Iraq. This was a decompression trip for him. We drove in to town for something.... and when we returned there was another tent near us.... but curiously no car. I saw a lady outside working on something, so I went to offer her some help. I asked if their car broke down, and offered help, tools and a ride if they needed.

She told me they were doing the continental divide trail, they had no car. So I offered her a couple of cold sodas, figuring that was something they didn't pack. She accepted. But a short while later she returned the sodas un-opened. She said the cans were too heavy to carry out as trash. They only had 1 small flashlight.

I smiled and pointed to our 1-ton Ford van, told her it hauled trash just fine. She could toss the empty cans in my trash, and anything else they needed to dispose of. She was quite happy. We welcomed them to join us at our fire, and kinda just enjoyed the visit. The next morning they were off, and a bit lighter in pack weight too.

"I don't understand why you want a solar collector at all, though": Because not everybody returns to their cozy shack to recharge their batteries after every outing, or because your standard plug-in charge controller is rendered useless if the next natural disaster or military attack knocks the power

grid offline for any significant amount of time, or maybe I just think it's fun to use a natural, inexpensive and virtually endless power supply to run my toys...

Hello,

Well, I went with the Goal Zero 7W solar panel that recharges four AA NiMH cells at a time... Got an eight-cell battery holder and sixteen 2850mAh batteries.. The LiPo solution was starting to look a bit too pricey and complicated. I opted for cheap & simple. Using AAs will also allow me to power other small devices, and recharge my iPod with the USB cable.

You guys who use the MTR with eight cells, how long do you get?

Thanks to all the replies by the way :-)

Gil.

The Par/LNR "Multiband QRP" matchbox covers 10m also. It resonates the supplied 20m element as a full wave on 10m since the full wave impedance is similar to half wave impedance, although this results in a higher takeoff angle when mounted vertically and multiple azimuthal lobes when mounted horizontally.

The original EF-20/40 (Par's first broadband unit) was rated at 25 Watts (I've had one since 2004). Their latest "Multiband 100W" EF-20/40 is rated at 100W (NOT the "Multiband QRP" EF-10/20/40MKII which is still rated at 25W). As you said you can use their "Multiband QRP" matchbox for any halfwave from 10-40m but I'm not sure that applies to their current "Multiband 100W" EF-20/40. See the full lineup below which should clear up any confusion:

http://www.lnrprecision.com/endfedz-specs/

Larry AE4LD is the owner of LNR and attended our SOTA Forum at the Charlotte Hamfest a few weeks ago. He has greatly expanded the Par product line since purchasing it over from Dale W4OP a few years ago.

10706. 2nd Run MTR alignment.

Topic: 10706 Message: 10706

I was lucky enough to build one of the first run MTR's.

I've been reading the new MTR manual in readiness to receive the new kit. I'm particularly interested in the calibration procedure.

When I built my MTR last year, I remember measuring the response of the crystal filter using an O'scope and stepping the LO through the filter with the up / down buttons to find each 'end' of the filter. The number of clicks of the tune buttons from end to end of the filter was then divided by two to find the centre frequency of the crystal filter. To finish the procedure, the BFO trimmer was peaked for maximum audio out.

I've noticed that the above stated instructions are longer included in the new MTR manual. I'm assuming as the parts tolerances are expected to be very good, so that the starting off point before any calibration will be pretty good, that the above step is no longer required.

My question is - Would it still be beneficial to follow the original instructions to get everything 'spot-on'?

I am fairly new to this group and to small semiconductor radio design, and I have a few questions in the light of a couple of the recent threads--

1. Steve, in response to the information about the Etherkit CC1, you mentioned the transmitter circuit that you invented 10 years ago that provides the shaping of the output signal. Just curious what components on the schematic of this latest MTR comprise this circuit? And how does it work? I just built a qrpkits Ft Tuthill 15 and, using the computer program TINA, have been trying to model and analyze the effects of its "Finals V+ Supply Rise/Fall Shaping" circuit, which I assume is intended to accomplish the same purpose as the circuit you mentioned (?). Also, do you ever use a CAD modeling program, and, if so, which one?

2. Steve, what are your thoughts on using the Silicon Labs Si570 Crystal Oscillator in your ATS series and MTR series rigs instead of the AD9834 DDS? And a QSD Tayloe mixer or just a single capacitor detector as in the Ft Tuthill 15?

3. Has anyone used both the Palm Radio Mini-Paddle and the American Morse Porta-Paddle, and how would you compare the two?

Thanks to everyone for the wealth of information shared in this group and, in advance, for answering these questions and helping me to understand more of this great hobby of ours,

Earle

I don't like the "springiness" in the Palm Paddle, so I got a PortaPaddle.
It's not too bad, but needs to be anchored to use - I'm using a leg strap
I made from a velcro strip...it really needs to be more stable than that
for me, which is why some of my SOTA sending is a little wonky. But it's
not so bad that I've tried too hard to figure out a better solution.

Topic: 10665 Message: 10711

I was exploring the use of the fixed matching unit, and had only preprared a 20M EFHW wire exactly tuned to match up with that device. I also have a 20/30 trapped wire, but have not tested/tuned it for the fixed matching device yet.

Yes, i would choose 30M. Most SOTA activations take place in summer and mid-day since one has to drive, hike, and set up. 40M mid-day in summer presents high absorption making 40M very difficult. Out here in the Rockies, there may be no one, zero contacts, on 40M under such circumstances.

73, fred - kt5x (aka WS0TA)

Fred, I see you chose 30m and 20m for the MTR frequencies but mention only a 20m EFHW. Do you use 30m much? If you had it to do over would you still choose 30m instead of 40m?

measurements made with the QRP-O-Meter ...

10 volts = 4.0 watts out

10.5 volts = 5.0 watts out

12.4 volts = 5.75 watts out

I use a 500 mAH LiPO battery that will power the radio for about three hours. This battery weighs less than two ounces. I also have a 1,000 mAH battery which weighs about 3 ounces and would power the radio about five hours, and a 2.2 AH LiPO that weighs 8 ounces and which would power the radio for something like 12 hours of continuous use with a lot of transmitting.

I have two sub-mini toggles between the battery and the radio. one introduces a single diode and point seven volts drop and the other introduces three diodes in series or 2.1 volt drop. Together can get 2.8 volt drop, or into the nine volt range.

The battery fully charged produces 12.4 volts, but quickly drops to 11.6 volts where it is flat for a long time.

So ... I can keep the voltage below 10 volts for tuning up. And clearly, there is no reason to run the voltage any higher than 10.5 or 11 volts for full output.

I'll have this radio on a SOTA peak later today, 2000z on 14.061 using the call sign WS-zero-TA, WS0TA/

I'm still not convinced, although that is the way I was leaning. It could be a difference between the Southeast and the Rockies though.

I had a number of failed SOTA activation attempts last summer due to lightning. In our corner of the country, thunderstorms are an almost daily occurrence during the summer...they often start as early as 11 am (or even earlier). I don't want to be on a mountain when a T-storm comes through, and was not able to reliably plan an activation around the WX until fall. By then, 40m worked fine here during the day with many "local" contacts. I also wonder if it could just be regional - with the greater population density in the East, 40m may just be more viable year 'round for us.

And I'm concerned that 30m isn't "local enough".

I suppose I could try one or the other and then change my band selection if it just didn't work out like I'd like. I haven't looked at the manual, but there should only be a few caps and a couple of toroids to change, along with the band-change resistor, correct?

I've only activated a few times on 30M, but one reason I'm leaning toward 30M is that QRM, whether unintentional or intentional, seems far too prevalent on 40M cw. Also, 30M means a smaller wire antenna or better AlexLoop (my snow antenna) efficiency.

Yes, it may be regional. You have a MUCH higher population density. And the earlier in the AM you activate, the better your chances, reduced absorption. I can call CQ on 40M, QRP, mid-day and work no one, zero, nada.

30M has a very significant skip-zone. it varies a lot but is typically several hundred miles.

I was going to eliminate the calibration all together assuming the 20 ppm clocks would be "close enough", but in the end decided to leave well enough alone and kept the calibration routines as they always were. I thought I had restored the manual back to original also, but I guess that step didn't get back in.

So, if you want to see if you can center the LO in the filter better than the default values do, go ahead. Otherwise, leave well enough alone...

1, The wave shaping isn't original with me, it has been used with Class C transistor transmitters for some time and for the same reason. The square wave driven mosfet or a Class C amplifier has no linear region so they simply turn on and off. Signals which have fast turn on and turn off times (like squarewaves) have a large harmonic content and therefore increased bandwidth. To help reduce that, the supply is ramped up and down, typically at about a 5 ms rate.

The one difference is taht in the bi-polar transistor Class C transmitter, it is possible to only ramp the supply for the driver up and down, which requires a minimum of current. With the logic gate transmitter, that is not possible because they have very well defined and very narrow switching points, where they are either on or off. That is what helps make them more efficent. But that means instead of controlling the voltage going to the driver, it must be done at the PA, at much higher current. The circuit which does that in the MTR and ATS rigs is a P channel power mosfet, which is in series between the PA fets and supply voltage. The RC network from the gate to drain and source makes it an intergrater, resulting in a 5 ms linear ramp.

No, I do not use a CAD modeling program. Don't have the time to fool with that.

2, The problem with the Si570 is that it draws like 100 ma all by it's self. It's also a real pain in the butt to calculate the desired output frequency and load it. The thing was really designed to be programmed once and then left alone. It also has a fairly high mininum output freqency, which is okay if your dividing it by 4 for a clock in a direct conversion phasing SDR receiver, but not so good for our application. Thier also pretty expensive and not easy to get.

Unless you can intergrate a DSP chip into the rig, doing direct conversion is not worth it when a simple super heterodyne with xtal filter works so much better.

3, I don't own either paddle so can't comment.

1. Steve, in response to the information about the Etherkit CC1, you mentioned the transmitter circuit that you invented 10 years ago that provides the shaping of the output signal. Just curious what components on the schematic of this latest MTR comprise this circuit? And how does it work? For anyone interested in the Si570 - a group buy has been organized as there's a hefty discount on bulk orders. So you can grab one for $14 vs. $25. Ends in a week.

https://www.tindie.com/shops/TAUTIC/si570-xo-programmable-oscillator/

That said - I'm anticipating building a little DIY paddle for portable use. I have an extra set of aluminum finger pieces from Begali that I plan on using and I'll likely construct it from PCB board that I can etch and solder a jack to.

Anticipating MTR #79 (from recent batch anyway) as early as today. I plan on a small blog post with some comparison pictures of the case. Just need something to compare it to! Excited!

I got one a couple weeks back from K5BCQ for 17 bucks delivered as a replacement for one I had lost from one of his kits. I believe that is the same price KM5H sells them for as well, but not sure. AFAIK, that's their regular price...not as good as 14 bucks, but better than 25!

Earle,

LT Spice is free to use, and a truly great tool
for simulating analog circuits, and graphing the results.

Download LT Spice from www.linear.com/ltspice
Then suck in KE7ER/keyclick01.png from the files section
and play with it. And maybe go through the ltspice
tutorial if you have the time. There are help forums
for LT Spice if you have questions about it.
You can see exactly how the keying circuit works.

If you dare, take a look at the long thread summarized here:
http://groups.yahoo.com/group/AT_Sprint/message/1120
In it we bullied Steve into moving from a standard RC style
shaping circuit to something with a bit of capacitive
feedback around that PFET to give a nice trapezoidal shape.
As in keyclick01. Without adding just too many parts.
Mostly because it looked so pretty.

Jerry, KE7ER

> 1. Steve, in response to the information about the Etherkit CC1, you mentioned the transmitter circuit that you invented 10 years ago that provides the shaping of the output signal. Just curious what components on the schematic of this latest MTR comprise this circuit? And how does it work?

How about a 33' radiator for both 20 and 40? On 20 use the EFHW matchbox...on 40 remove it and add a single 33' radial fed directly as a 1/4 wave vertical. See "Using an EF-20 matchbox on 40M ☐ Another Solution" at the very bottom of this page:

10726. My 1st "mountain topping" with my ATS-3b

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-27 18:42:14 UTC
From: dk7fh
Topic: 10726 Message: 10726

Spending this years easter holidays in a hotel, which is located down in a valley, I had the idea this morning to improve my qso chances. I climbed up the next hill to do some "mountain topping" with my just finished ATS-3b. I reached the top heavyly breething and as I unpacked my rig, I realized that I forgot important devices in the hotel, such as my z-match and the swr meter and connecting coax cabel and adapters. Still I had several pieces of wire and a 8 meters long fishing rod. So I connected the wires to reach a length of about 2x10 meters, stuck one piece in the center of the antenna bnc jack and twirled the end of the other wire around the bnc-shield, one leg fixed at the end of the fishing pole, the other lying flat on the earth. And, oh wonder, the high swr protection didn't switch off the tx. This way I tried the first qso on 40 and reached Mike, M6MPC in Manchester (about 700 km), who was also running qrp, with the first call! Later 2 qso's with German op's followed, one of them also in qrp. What a fun, believe me, although the temperature was just a bit above the freezing point.

So my rig was only the ATS-3b with 9V block battery, phones, a microswitch as key (see fotos)and some kind of direct fed upper and outer antenna. Now, it seems, I am infected by the virus of performing ham operation by using minimalized equipment outside in nature.

OR, one more solution is to use an adjustable EF tuner (Hendricks SOTA Tuner is one) and use the same 66' foot wire as a halfwave on 40m and a fullwave for 20m. That's what I've been using almost exclusively for a year now. It works well.

It's also one reason why I am going to configure my MTR to 20/40 - the same antenna used for both bands with just slight turn of the polyvaricon...

Just a reminder, as mentioned numerous times recently on varous forums: a full wave end-fed wire is a poor vertical radiator (high rad angle) and has a multi-lobed non-broadside pattern as a horizontal radiator. I think a trap would be a better solution than running it full wave.

Good points, Barry, Thanks.

However, in my activations and with some informal testing, the 20m full wave (set up as an inverted vee) has played just as well as an elevated vertical or as an EFHW. But you have encouraged me to try some more testing - perhaps this weekend you'll have a chance to give a listen and let me know what you hear.

Regards,
Etienne-K7ATN

I agree with that - plus the trap will shorten the antenna slightly, and the loss shouldn't be objectionable. I've experimented with traps with my Par 10/20/40 matchbox and it seems to do OK, so I will probably build a dedicated trapped two-band EFHW for my MTR.

10737. Re: [AT_Sprint] Antenna to use with the MTR?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-27 20:27:39 UTC
From: Hank Greeb
Topic: 10665 Message: 10737

I can vouch for the following:

The "very very very best" portable antenna I've used has been a 130' dipole, fed in the center with 400 ohm (nominal) window line, and supported by two 70' tall "naturally occurring antenna supports" which were conveniently located about 150 feet apart.

I realize this kind of antenna is a bit difficult to get to the top of a mountain, so I have another quite useful choice

I have a 31' jackite pole, a bit heavy for mountain topping, but a much lighter carbon fiber 31' pole has been mentioned as an alternative. I support a 33' wire with it, and put the rig a convenient distance from the pole so that it is supported. I also have a 33' counterpoise. It works fine with my automatic Z-100 ATU (which may be a bit heavy for mountain topping, but most any ATU capable of wide range matching would work). I find it actually works on 40 without the ATU, with SWR between 2/1 and 3/1. Yes, I suppose I could tweak the length to get a better SWR, but at 9 volts my rig puts out 3 watts. On 20 meters an ATU is needed. And, the purist would say I should shorten the counterpoise to 16 feet or so, but I find that it works FB.

But, if you have a convenient "naturally occurring antenna support of 20' or higher, just throw the wire over a branch and it will usually work fine on 20/30/40 meters. (whichever is your choice.)

As of today, there are 97 in the mail. They are being sent out in batches, more or less in the order checks were received. I've been doing "click n ship", which turned out to be some what time consuming. It might have been quicker to have the PO do it, but then I get lines behind me which streach out the door and then I get a lot of dirty looks, hi.

The last 50 are in limbo at the moment (mostly DX orders as they take the longest to process) as I ran out of boxes and the ones I ordered haven't arrived yet. I cleaned out all of the boxes from two post offices and they are waiting for mine to show up so I can restock them :) Hopefully they will show up tomorrow so I can finish this job up!

Don't worry, the virus with which you've been infected is one of the several beneficial retroviruses which ward off or cure diseases. :)

p.s. Nice Writeup! Good DX, OM! When will you climbthe Matterhorn? Please let us know, and we'll all be looking for you on 20, 17, or 15 meters!

p.p.s. Make a list of "everything" needed for an outing. That's the only way I've found to minimize (but not eliminate) the "%$#^& why did I forget that" moment on an outdoor operation.

From: Mike Olbrisch
Topic: 10673 Message: 10749

I wish they made something that could cover 15m and 30m too. OR - like the 10-20-40 relationship, 15-30-60m. 15m and 30m are pretty good bands for me here out west. I do not think I have ever worked any Euro-DX from a summit on 20m, but I sure have on 15m.

So I am working on building my own..... for 15m-17m-20m-30m... and maybe 40m.

Mike - KD9KC.

Subject: [AT_Sprint] Re: EFHW tuner

The Par/LNR "Multiband QRP" matchbox covers 10m also. It resonates the supplied 20m element as a full wave on 10m since the full wave impedance is similar to half wave impedance, although this results in a higher takeoff angle when mounted vertically and multiple azimuthal lobes when mounted horizontally.

The original EF-20/40 (Par's first broadband unit) was rated at 25 Watts (I've had one since 2004). Their latest "Multiband 100W" EF-20/40 is rated at 100W (NOT the "Multiband QRP" EF-10/20/40MKII which is still rated at 25W). As you said you can use their "Multiband QRP" matchbox for any halfwave from 10-40m but I'm not sure that applies to their current "Multiband 100W" EF-20/40. See the full lineup below which should clear up any confusion:

http://www.lnrprecision.com/endfedz-specs/

Larry AE4LD is the owner of LNR and attended our SOTA Forum at the Charlotte Hamfest a few weeks ago. He has greatly expanded the Par product line since purchasing it over from Dale W4OP a few years ago.

I just built my better QRP tuner earlier this week. It is VERY good -- especially if you understand how they work and how to correctly tune the wire for length first.

Regards,
Chris Maness KQ6UP

"They" is Steve Weber, KD1JV, and he has an excellent, just slightly heavier, rig called the AT-Sprint version 3b. It covers all the bands from 80 through 15 meters, 3 watts @ 9 VDC, 5 watts @ 12 VDC.

The Mountain Topper has a lower frequency DDS, so it can't cover 15 meters - but the power consumptionis considerably less on receive. Less power consumption means that the weight of the battery can be less for equal batterycharge life. Many mountain climbers value weight more highly than band versatility.

Another "advantage" ofMTR is that the two bands are switch selectable, so it is very easy to change bands, and no possibility of losing a band module over a cliff when trying to change a band in a high wind condition at the top of a mountain.

"They" is Steve Weber, KD1JV, and he has an excellent, just slightly heavier, rig called the AT-Sprint version 3b. It covers all the bands from 80 through 15 meters, 3 watts @ 9 VDC, 5 watts @ 12 VDC.

The Mountain Topper has a lower frequency DDS, so it can't cover 15 meters - but the power consumption is considerably less on receive. Less power consumption means that the weight of the battery can be less for equal battery charge life. Many mountain climbers value weight more highly than band versatility.

Another "advantage" of MTR is that the two bands are switch selectable, so it is very easy to change bands, and no possibility of losing a band module over a cliff when trying to change a band in a high wind condition at the top of a mountain.

Yeah, I read "tuner" but figured that a tuner is such a simplething that having to "design" something which covers such a wide frequency range would be reinventing the wheel. For example, Steven Weberdesigned such a tuner years ago, and it is now being sold in a slightly modified form by Dough Hendricks. Info is at
http://www.qrpkits.com/sltplus.html
Again, if you want a smaller, lighter implementation of such a design, there may be tradeoffs.

Ummmmm..... I didn't write anything about TUNER. It was ALL ANTENNA. Sorry - it is what it is.....

I was saying it would be nice if THEY made an antenna for 15-30-60m like THEY make an antenna for 10-20-40m. THEY is certainly not KD1JV, who makes great radios but not EFHWAs - AFAIK.

Sorry you mis-understood.

Today I received a micro wonder! The case is amazing! Yahoo pics did not do it justice. Only slightly taller than an Altoids case and bullet proof solid.

How Steve get's the energy to design, part, bag, and ship small quantities for us with such professional and technical quality I'm not sure, but thank you!

I assume the serial numbers are sequential from the first run, and not starting with this year's run, but not sure.

So does the LNR EF-10/40MKII (and even 10m)...with NO TUNING required once the wire is pruned. However both units need a separate 1/2 wl wire for each band. The LNR actually can cover two bands with one wire and no tuning but the higher band is a full wavelength (e.g. 40/20 with one 66' wire or 20/10 with one 33' wire).

Larry AE4LD will be introducing a EF-10/40 Hiker beta unit for QRP this weekend at the Raleigh Hamfest. It weighs ~3.5 oz and includes some sort of wire storage. I'll have one in a few days and will report when I get it.

Another option for 40m/20m would be to go with a 66 ft EFHW for 40m but
break it into two sections using a small insulator that you can bridge with a cliplead
(think Segmented SOTA dipole). Then moving a single cliplead would allow you
to switch between a 40m & 20m EFHW and still use the same EFHW tuner.
This is a bit more work than some sort of trap mechanism but it is efficient,
simple and cheap.

In fact what you can do is use fishing snap swivels to physically connect the second 33ft
section to the end insulator so if you are only planning to work 20m then you don't need to
physically attach the second 33 ft length. You can erect it as an inverted vee for 40m and
on 20m you end up with an end fed sloping dipole. The only disadvantage is you need
to drop the center of the antenna to switch bands.

Michael VE3WMB

P.S. The 40m/20m scenario above could of course also be applied to 30m/20m, with
the total length of the antenna being a half wave for 30m with the split located so that
opening the cliplead connection gives you the EFHW for 20m.

Phil AD5X made a backpackable 100-Watt, 10-40m switched dipole.

http://www.ad5x.com/images/Articles/Dipole%20RevA.pdf

I made a different version of the same thing but it covers all bands from 6-30m, no coils. All bands are full sized and yet it wouldn't take much to add 40, 60, and 80 to the design. I changed his design a bit and changed the coax and wire out and replaced it with a single pair from Cat5 cable and a switchable balun that I redesigned from the Elecraft BL-2. The switches are the smallest Radio Shack DPDT micro switches for a total weight of 5.323 oz including the balun. All packs inside a quart sized Baggie, although I recommend a kite string spool to keep it manageable.

The Cat5 TP has the same loss as RG-58 and can lay next to other metal, ground, obstructions with little effect because of the tight coupling (twisting) after all, there are three other pairs that lay next to each other in the sheath with very little coupling. Yes, they have different twist pitches but still.

As for power handling at 100-Watts? Well, the balun was tested at 100-Watts and I wouldn't hesitate putting 100-Watts into RG-58/Cat5.

I support my switched dipole with a 23' carbon fiber fishing pole (which has no effect on my dipole) up 20.5 feet (bends over slightly). The 20.5 feet vertical transmission line is a tuned length to target the feed point impedance to either 50 or 200 Ohms through ALL bands.

Please see wv0h.blogspot.com for more details.

Yes that article is essential to understanding the theory behind the antenna, and the practical tips therein helped me to achieve stability on 15m.

From: Alan Shapiro
Topic: 10665 Message: 10770

My 40m half wave end-fed with KI6J tuner with a simple mod works for 40, 20, and 15m. Here is the explanation: as long as you have an integral number of half wave lengths you are good to go. A 40m half wave length equals 2 half waves on 20m and 3 on 15m. The mod to the tuner is to use only the smaller capacitance section of the polyvaricon for the higher frequencies. Do this to get a lower base capacitance to work with. Thanks to Fred, KT5X, for this idea.

Alan, NM5S

Yes, but it's going to be a challenge to orient that 66ft wire so that a radiation lobe points in the desired direction of propagation on every band. You have 2 lobes on 40M (max@0deg to broadside), 4 lobes on 20M (max@36deg), and 6 lobes on 15M (max@50deg)

Would maybe a bunch of AAA cells fit in there?

Not quite. They would if you didn't need a battery holder, so if you can tack weld jumper straps to the ends like ni-cad bundles use, you probably could.

Maybe. The metal they use on the ends doesn't take solder well, but I find if you clean it up with a scotchbright pad first, it goes a little easier. You'd want a really hot iron, like a gun so you can make the connection quickly. That would limit the amount of heat transfering into to the battery.

Steve

You can take your batteries to Battery's Plus and they will, for a few bucks, spot weld the battery's together. Much better foe the battery.

Any antenna longer than ~40' is a non-starter for me. Ideally I want to cover both 40 and 20 with one 33' piece of wire and no "lumps" to get hung up in tree branches. Configuring a 33' wire on 40 as a 1/4 wave vertical will work but it requires too complex a ground system for portable operation. On 40m I've been able to tune a 33' wire > PAR EF-10/40 matchbox > ZM-2 tuner. I'm in the process of testing to see if that radiates well enough to be heard. I don't need much efficiency on 40 since most contacts are within a few hundred miles. Will post here if RBNs can hear me!

This is a straight 33' vertical wire > PAR EF-10/40 > ZM-2. ZM-2 tuning was a bit critical but this may be "good enough":

W4AX W4ZV 1 dB 248 miles WSW
WZ7I W4ZV 12 dB 443 miles NE
W4KKN W4ZV 11 dB 270 miles NNE
NY3A W4ZV 14 dB 353 miles NNE

My next experiment was testing a trapped 20/30 EFHW vertical about 40.5' overall through the same ZM-2 tuner. No grounds for either test BTW.

W4KKN K4URE 13 dB 270 miles NNE
NY3A K4URE 21 dB 353 miles NNE
W3LPL K4URE 8 dB 320 miles NNE
WZ7I K4URE 22 dB 443 miles NE
K1TTT K4URE 9 dB 622 miles NE

This was a little better since the overall length is 40.5' versus 33' with some center loading due to the 20m trap. Tuning was not quite as critical on the ZM-2 compared to the first antenna. I picked up a couple of new RBNs but dropped W4AX in GA. The price for the better signal is longer wire plus one "lump" due to the 20m trap.

These tests were ~20 minutes apart but more testing will be done at different times of day. I need to determine if the 33' wire alone is sufficient for 40m since I really prefer its physical simplicity.

>

The problem with a 33 foot antenna on 40 is that is a 1/4 wave and therefore low impedance of about 50 ohms, so a tuner designed for high impedance isn't going to like it. Making it a bit longer will rise the impedance, making it easier to match with a high impedance tuner.

The ideal 40/20 EFHW is a bit shorter then 66 feet to make the impedance a bit lower then really high. That's why I recommend about 51 feet for my L tuner. This is a litte shorter then 1/2 wave on 40 and full wave on 20. For 30, different length is required, since you want to be in the neighbor hood of 1/2 wave or multipels for an EFHW.

When they added the non-harmomically related WARC bands, it tossed a monkey wrench into multi-band antenna design...

Really?

A 1.3 AH Li-Po costs $9.95, and only weighs 115 grams (4 ounces).

The advantage to your drill battery is you have it. The disadvantage is that it is heavier, and when you need to replace it, the cost is 3 times more. At $9.95, the Sky Lipo is almost a throw-away.

The 800 MAH is only about $7, weighs 70 grams (2.5 ounces), and will run any of the AT series radios for hours. That is what I keep in a small pouch with the ATS-4.

There are smaller and lighter solutions - for pennies.... but again, you have the drill battery.

Good luck with it.

From: Skyridr
Topic: 10785 Message: 10785

To reduce the chances of placing resistors and capacitors in the wrong places, a fine tipped felt pen can be used to mark between the solder pads where components of a similar value should go. The marks will be covered by the component, of course.

I still use the old fashioned solder iron method of mounting components. Tweezers that are small and light are used to move small components around on the pcb. The tweezers are designed for handling insect eggs. I use an assembly platform that is 7 inches square on a 4 inch frame. The platform is recessed about 1/4 inch down from the top of the frame, this helps to keep parts from sliding away to wherever those sm things go. I can post some photos if anyone is interested.

I never investigated why, but using ATS-3B portable from Poirier Lake, Ontario, a 34' wire connected to a KI6J EFHW tuner worked well on 20M and 30M with no setting changes and no counterpoise. Others reported same experience which is why I only took the 20M and 30M modules with me to the lake.

Have contemplated building a fixed matching network based on the settings from that tuner to go with my new MTR which plan building for 20 and 30.

From: Hank Greeb
Topic: 10673 Message: 10789

I made an antenna back in 1952 which worked FB on 80/40 and 11 Meters - the three bands for which I had crystals at the time. It was a "invertedL" length to gofrom one outbuilding (shack) and another (our cow barn). I "guessed" at about 100' of wire, don't thinkI ever measured it. My pappy (Then w?hzp, now SK) taught be by example to throw up a wire between two convenient points, end feed itthrough a low loss impedance matching device and forgetall the calculations. Actually, I didn'toperate on 40 until later in 1952, when I got my general ticket.

Over the years I've found that most any wire fed at the end will work on any band. If it's fed at one end,it works best if it's around 1/4 wavelength at the longest wavelength one desires to use. Center feeding gets critical and a bit unpredictable ifit's much lower than 3/8 wavelength. Seems like if a 15 year old novice can built such an antenna which managed about 40 states on 80 meters, and VK2 on 11 meters (the one and only contact I remember on 11 meters), it oughta be easy now a daze with computer modeling, etc.

I haven't experimented much with end feeding anything but a 33' chunk of wire for 40/30/20 meters recently. It works fine as a vertical, supported by a 31' Jackite pole, with a 33' counterpoise, and a LDG Z-100 ATU impedancematching device. Yep, I "made" this antenna - as I made my 130' center fed dipole, which I usually use as an inverted V, but sometimes as ahorizontal radiator.

Of course,any antenna is a matterof choice and often, of compromise. To me, mechanicalsimplicity is of high value, that's why I have one pole, currently at 32feet high but capable of being40 feet or higher, and and the attached 130feet of wire is configuredas an inverted V. I haven't bothered tofigure out theradiation pattern, but I worka "reasonable" smattering of domestic and DX stations during various contests.

The 130' wire isn't very portable, but for "easier"mountain topping (anything less than the 14er's of the Coloradioand surrounding states which have theRocky Mountains) a Jackite pole or lightercarbonfibre pole, a hunk ofwire and a versatile impedance matching device like Steven Weber's L-match tuner is a fair tomiddling excuse for a radiator on most any band 40 thru 10 meters.

From: Colin
Topic: 10787 Message: 10790

Steve posted earlier that the first batch of MTRs was for 150 off, serial numbers 1 to 150 inclusive, and the second batch was also for 150 off units, but with only 149 being offered for sale as he was keeping the last the last one for himself. Serial numbers for the second batch start at 151 and must go up to 300 inclusive.

Subject: [AT_Sprint] MTR Surface mount parts placement

To reduce the chances of placing resistors and capacitors in the wrong places, a fine tipped felt pen can be used to mark between the solder pads where components of a similar value should go. The marks will be covered by the component, of course.

I still use the old fashioned solder iron method of mounting components. Tweezers that are small and light are used to move small components around on the pcb. The tweezers are designed for handling insect eggs. I use an assembly platform that is 7 inches square on a 4 inch frame. The platform is recessed about 1/4 inch down from the top of the frame, this helps to keep parts from sliding away to wherever those sm things go. I can post some photos if anyone is interested.

Steve et al :

I have used the recommended 51 footer with my ALT tuner for years and it does match very well on 40m / 20m. If you want to use it on 30m the match isn't quite as good but rolling up a couple of feet of the wire at the end fixes it for 30m.

Michael VE3WMB

P.S. The ALT is a brilliant design. Very simple but effective, the only issue of course is making sure that you don't lose the little 2 pin headers, but I found that using the pliers on my little leatherman tool to move the headers around is a lot easier than fingers.

Hank et al :

Perhaps the "best" length of end-fed wire for coverage of the HF spectrum with an L tuner is 86 feet. This is not near a multiple of a half wave on any of the HF bands with perhaps the exception of 10m so it presents a reasonable impedance that can be matched with a tuner. It is not surprising that this is close to the 84 ft length of the W3EDP, as W3EDP arrived at his 84ft length by repeatedly starting with 100 ft of wire and chopping 4 feet off at a time and trying it out for a few days until he found that 84 feet seemed to work the best.

I have found that 86 ft of #26 AWG Silver-plated teflon coated wire will easily fit on a camping clothesline reel and can be deployed as an inverted-L or inverted vee in the field with pretty decent results for an all band wire.

Also, has anyone tried using an isolation transformer three feet down from a EFHW antenna to isolate the common mode RF that limits deployment to short lengths of coax, or would several turns of RG-174 around a toroid be sufficient to isolate the antenna from common mode currents as well? I don't always want to have to be stuck feeding the thing very close to the tuner.

Thanks,
Chris KQ6UP

Probably no difference at all... both are very close to the Cebik classic 88 foot doublet.

Hank et al :

Perhaps the "best" length of end-fed wire for coverage of the HF spectrum with an
L tuner is 86 feet. This is not near a multiple of a half wave on any of the HF bands
with perhaps the exception of 10m so it presents a reasonable impedance that can be matched with a tuner. It is not surprising that this is close to the 84 ft length of the
W3EDP, as W3EDP arrived at his 84ft length by repeatedly starting with 100 ft of wire

and chopping 4 feet off at a time and trying it out for a few days until he found that
84 feet seemed to work the best.

I have found that 86 ft of #26 AWG Silver-plated teflon coated wire will easily fit on
a camping clothesline reel and can be deployed as an inverted-L or inverted vee in the field with pretty decent results for an all band wire.

10803. Re:: EFHW tuner

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-03-29 15:49:04 UTC
From: cloud runner
Topic: 10803 Message: 10803

I remember reading that trying to keep the common mode off the coax is not a good idea in this instance.

Further, keeping the coax short IS a good idea. In fact, I often use no coax at all, mount the radio on the pole with direct connection, but right now am using a five foot piece of RG-174.

Am getting ready to do some tests on tuner efficiency. Getting a match isn't always a good thing. it may be a dummy load ;-)

fred - kt5x

Also, has anyone tried using an isolation transformer three feet down from a EFHW antenna to isolate the common mode RF that limits deployment to short lengths of coax, or would several turns of RG-174 around a toroid be sufficient to isolate the antenna from common mode currents as well? I don't always want to have to be stuck feeding the thing very close to the tuner.

Thanks,
Chris KQ6UP

.

Yes, there needs to be a small counterpoise. The common mode on the coax is the counterpoise, so I was suggesting putting the choke at three feet from the antenna so that longer there is still some common mode current.

Just a thought.

I picked up a YSD-998 battery LI-ion on eBay for < 40$ US. Light weight, 3 output voltages 5vdc at 15000 mAh, 9vdc 8500 mAh, and 12vdc 15000 mAh (This is what they claim anyway). It came with the very small wall charger. The only strange thing is the battery must be turned on to charge (red and green led indicate charging, red light only means finished).

I liked the 9 volt output for tuning and 12 volt for QRP High Power. Not sure the long term quality of this battery yet, time will tell. Been using it with my KX3 without problem and it was plug and play with its included cables.

Will be using this with the MTR for sure!

My experience with the Chinese batteries (not your exact unit) has been that they work, but do not meet their ratings except MAYBE at a very low load-rate.

I had an engineer friend check one of the "blue" models, and the 9800 MAH promised turned out to be about 5600 MAH at a 1-amp load. Since the load was 1 amp, you can interpolate the numbers yourself and get an idea of what it might do.

Of course, JMHO - YMMV - MDHF and all that.

Mike - KD9KC.

I figured that too. Just noticed the typo! 6500 MAH not 15000 at 12vdc. I plan on working up the current profile of the MTR to see how many hours of normal operation I can predict vs the real life capability of this battery (low current load test. Li-ion batteries are not so happy with high current testing).

Thank you for the input. I will post the results when I have more details.

If the YSD-998's power switch must be on for 12v to come out,
maybe rewire the battery directly to 12v out. Then the switching
power supplies for 5 and 9v won't be cooking up hash for your radio.
That thing should run an MTR for a month's hike.

This one too, and then start your Geo Metro if you left lights on:
http://www.hobbypartz.com/77p-sl5000-3s1p-30c-3333.html
Weighs under a pound and delivers 150 Amps?

Does Sky Lipo stuff work? Meet spec?
Any other favored brands?

Just completed it, works great! Thanks Mr Weber!

If anyone is wondering if a BNC fits instead of the RCA plug, it does…
Ah, and R45 is 102.. It's on the schematic only..

Gil.

Looks like R45 is new to this build, inserted into the collector
of Q2. Find it under the IF crystal filter.
Another good spot to add a resistor might be to pull up
the dot line, like R44 in the dash line.

Does the processor not have internal pull ups?
I would have thought that it would.

On page 32 of http://www.ti.com/lit/ds/symlink/msp430f2132.pdf
it says the MSP430's internal pullups are between 20K and 50K.

So, looks like the MSP430 has good solid internal pullups.
But leaves me wondering why R44 is in there.

I've just looked at the schematic Jerry and my guess is that R44 is there to prevent the 3.3volt regulator from burning out due to being being shorted out to ground by the dash line. The resistor will serve to limit current being drawn when the dash paddle is closed.

Without the resistor, you would effectively just be shorting the regulator output to ground every time you keyed the rig.

Scrap that, on closer inspection I see that the dash line is not connected to anything else. So whilst my explanation is valid for what R44 actually does, I'm not too sure why its fitted.

I'll put my thinking cap back on!!

I believe R44 is there as a second pullup on the dash line to insure that input cap (C54) is actually charged when the MCU "wakes up". This is beacuse that line is used to put the rig into "straight key" mode if it is low on power up. (dash paddle held in on power up).

Hello,

Well, only one issue so far: With a 10.8V power supply I get 1.2W out on 40m and 3.3W on 20m. I spaced the turns on the toroids, peaked the receiver, centered the BFO on the sidetone, all works great, but how can i up the power to the advertised numbers?

Thanks,

Gil.

20M power level sounds fine.
I would begin by making _absolutely_ sure that you have the correct number of turns on the 40M LPF toroids. Remember, once through the core is a turn. People often put an extra turn by counting turns around the outside, not passes through the middle.

Hi Gil,

Sounds like you are mostly there with your MTR. Sorry for the thread hijack!

Have you been through the suggested troubleshooting hints?

Are you sure that the TX lowpass filters are in the correct positions? I found it was quite difficult to understand which band fitted where until I really studied the manual.

Poor joints on toroid are easy to make and could be at fault.

Hope you get it sorted.

Thanks guys. Yes, I count turns the right way, but I'll double check.. It was the end of the build and I was tired.. Two five hour sessions.. The receiver works great. I just had a QSO with a friend on 20m, he was booming in real loud. He heard me just fine too. I am just a bit worried about power on 40m, 1.2W isn't much.. I'll get back to it later today or tomorrow, right now, I realized I forgot to eat since lunch yesterday and I'm starving! If I built kits every day I'd get real skinny!

Lol at the weight loss!

Well at least you know that the TX is working fine as all is common between the two bands until the low pass filter switch S7. It has to be a problem with either with the switch (dry joint?) or 40m low pass filter.

73 and good luck.
Colin

After looking over the parts for the MTR, my advice is:

1. Buy a magnifying glass, and be sure of the types and values of the parts as you put them on the board
or
2. Ask if someone on this list would like extra practice building another board for a nominal price.

I'm considering which one of the above I'll choose.

As for "all the parts the correct values" - from what I've heard, Steve does an super job of providing the correct parts. And, if for some reason you lose a part while sorting or putting them on board, Steve will typically replace one or two parts for no charge or a nominal donation.

Hank

Hi Hank,

It's unfortunate that there's several thousand miles between us as I would be honoured to build your MTR. I do surface mount soldering for a living, usually 0603 size.

So far one ham has taken me up on my offer to build his rig, so. I'm really looking forward to doing a first class job for him. I'm just thrilled that I'll get to build two MTR s this time around :)

Just for kicks I modeled the difference between the 86 and a 84 foot longwire. The two extra feet put it out of range of an L network with a 24micro henri variable inductor and 3900pF variable cap on all but two bands. The reactance was negative on all bands accept for 10m. I guess a couple of feet can make a difference.

Chris,

I expect there is no easy way to model it, but I wonder what impact trees have near the antenna. If a couple feet of wire can make a difference, I would suspect that trees, particularly nearby ones as one might have with a temporary field antenna, might have even more impact than wire length. It might be that being able to add or remove say 5 feet of wire could make the difference of getting matches or not in a forest (or elsewhere).

Subject: Re: [AT_Sprint] Re: EFHW tuner

Just for kicks I modeled the difference between the 86 and a 84 foot longwire. The two extra feet put it out of range of an L network with a 24micro henri variable inductor and 3900pF variable cap on all but two bands The reactance was negative on all bands accept for 10m. I guess a couple of feet can make a difference.

Yes this processor has internal pull ups.

However, the dash input is also used for the pocketdigi interface and that
port needs a well defined voltage of 1/2 the supply for the proper action
of converting the sine input from a sound card to square waves. Therefore,
that port required adding the external pull up, while the other didn't.

I am part way through assembly of MTR #192, and have notices a few things. Steve states that the highest frequency band should be assigned BND1. Keep this in mind when the band specific resistors are installed on page 8, or you might need to change them.

On page 9, capacitors for BND2 are listed as C74, C75, and C75. Check the circuit on page 22 to find the correct values for C74, C75, and C76.

The kit included the correct number of resistors, good job, Steve!

One strip of capacitors was not marked, they measured to be 330p.

I make my share of assembly errors. To help find misplaced capacitors, I marked all 101, 103, and 104s with green, red, or black dots. These are the most common, and were installed before the others. Yes, I found one that was wrong, and it could be identified by the colored dot.

I use a DIY capacitance/inductor meter with a test lead made from a small alligator clip. It works good, even with these small chips.

Good luck with your kits.

Hello everyone, and happy Easter :-)

First DX last night with the MTR on 40m: Estonia, 5200 miles, 1.2W!
I am still having a low power issue on 40m: 1.3W at 11V. 20m: 3.3W.
Everything else works great apparently.. Still scratching my head..
Ah, and my antenna is a PAR End-Fed 40/20/10, top is about 50' up.

Gil.

Hi,

Interesting about the bands. I did set up 20m as band 1, 40m as band 2.
When looking at the case, the switches are to the right for 20m, and
left for 40m. Is this normal?
I am still having a low power issue on 40m: 1.3W at 11V. 20m: 3.3W.

Gil.

Ga Robert (Bob?)
I have had great luck putting the "board in progress" carefully in a zip lock bag or Tupperware bowl and slip it in the fridge for a day or two while populating the board. It did not seem to cause a problem.
I think I have heard mention to this here on the reflector.
I first thought what you had placed you had to melt at the end of the day, but not necessarily so!

From: Steven Weber
Topic: 10840 Message: 10840

I'm not sure it would make much difference. The reason for adding the resistor is to slow down the responce of the AGC a little to help prevent overshoot. I found when using this circuit in the SSB rig, very strong signals would turn the audio attenuation full on, then take a few seconds to recover as for phone the AGC had a longer time constant. Adding the resistor helped eliminate the problem. I figured it might hlep to add it to the CW version, although it has a much faster T/C so recovers much quicker. Or if someone wanted a higher minimum volume, they could make the resistor value larger.

Make sure you didn't reverse the inductors. Also double check the soldering on the chip caps. Hopefully you got the correct values in the correct spots, as finding out if that is wrong could be a real problem without a capacitor meter. You might also have a problem with 20M, 3.3 W is actually more typical with a 9V supply.

From: Gil G.
Topic: 10843 Message: 10843
Attachments: 1 described; binary payloads are missing from this source WARC

Hello,

Sorry to bug you guys… I am really scratching my head on this one..
My MTR works great, but I get only a bit more than 1W on 40m (3.3W on 20m), with an 11V supply.
I counted the toroid turns, they are correct. The switches work. I peaked RX, works fine.
The only thing seemingly out of place is the "BandA" trimers on top tune 40m.
The "BandB" trimers tunes 20m… Shouldn't it be the opposite? Band1=BandA I assume..?
When looking at the case, 20m is switches on the right.
Turning the trimers affects RX but not TX output.
The band resistors are in the right place…

What next?

Thanks, any help would be greatly appreciated.

Gil.

Date: 2013-04-01 02:32:42 UTC
From: Skyridr
Topic: 10845 Message: 10845

I am struggling with capacitor identification for the MTN_2 kit.

Parts list, page 2: six 150p (151) BRN/GRN/BRN
13 100p (101) BRN/BLK/BRN

page 9: C51 150p (151) BRN/BLK/BRN
C57 150p (151) BRN/BLK/BRN
C47 150P (151) BRN/BLK/BRN

Capacitors that are already installed cannot be checked with the meter unless they are removed from the board.

Anyway this is a heads-up for guys who are just now starting on their kits.

Band A trimmers work with Band 2 parts. This is noted in the instructions.
I now realise I can fix this discepentcy, but it will take several hours of moving numbers around on the diagrams, which is why I think it's the way it is.

Just to see what would happen, I swapped the band select resistors. With 7 MHz going through the 14 MHz filter, power out is about 1.3 watts. However, with 14 MHz into the 7 MHz filter, there is no power out - proving the 2nd harmonic trap is pretty effective.

Since you do get power out on 20, the problem at hand isn't that simple but in some way does relate the low pass filter.

Sorry to bug you guys… I am really scratching my head on this one..

Gil,

With my stock build MTR, switches to the left select 40 meters.
The BANDA trimmers tune the 40 meter rx filter. Same as yours.

I'd suggest switching the rig over to 20 meters, then measuring
capacitance from ground to each of the three nodes around the
now mostly disconnected 40M L12 and L13. Compare those readings
with a rig that works. The coils will mess with the capacitance
readings of different instruments in different ways, so use the
same capacitance meter on both rigs for the comparison.

I bought a UT10A multimeter from dx.com for around $12. Small
enough to pack down the trail, and measures capacitance to within
10 or 20pF. That's usually close enough to verify you got the
right part, though you may want something more accurate to
diagnose your particular problem. Manual is in Chinese,
I wouldn't have read it anyway.

Good Luck!

Got up on a SOTA peak today, and my rig, a first-run MTR, did not transmit. Well, it made dits in the earbuds, but no RF on the Tayloe LED tuning indicator.

THIS could happen to you!

There is a short, as in 1/4 inch, jumper from the PC board to the RCA jack. It is difficult to tighten the nut on the RCA jack tight enough that it can not turn, especially if mounted in a light weigh Altoids tin.

If the RCA plug is tight and resists coming out of the jack, resist twisting it to get it out. If the RCA jack turns, it will snap the 1/4 inch long critical little wire just real quick ;-)

have fun, 73, Fred - KT5X

10857. Local oscillator freq./bfo adj. help needed

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-03 06:42:29 UTC
From: Tim Goodrich
Topic: 10857 Message: 10857

Hi Steve and all,

Finishing up my 1st run MTR here and making some adjustments, but ran into a potential problem. I'm at the step "local oscillator frequency trim and BFO adjustment". Using an o-scope connected to TP2, I get 2.5vdc with a very small audio AC component (20mv). Should the DC signal change as the frequency sweeps through the passband or is it the AC component that should change? Neither appears to change on my sweep test, even when changing the tone by a factor of 1.5khz (far outside the 500hz filter bandwidth). I do hear a low volume audio tone in the headphones that changes in frequency and all my voltages checked out as good on the audio chain ICs.

Also, is the 20mv AC signal I'm seeing typical or is it low?

Thank you,

Tim

K6TW

10858. Fixed it! (MTR C75 & C76).

First, thank you to all who made troubleshooting suggestions, and to Steve for correcting the manual. It turns out that I had inverted C75 and C76. On the chart, if you follow the "logical" order, you end-up reversing the caps (both C75 & C76 are labeled C75 in the old manual). Now with 10V I get 3W out on 20m and 4W on 40m. I have not tried 12V yet. So, one Watt less on 20m. Normal? I'm not going to sweat it..

Gil.

Ha! Thank you Sir. I think that might be why I have low power on 40m and a bit less on 20. I inverted C76/C75! It seemed logical to use C76=150 on the old manual…
Hopefully that will solve my problem. I suspect I wouldn't have been the last builder to do this..

Steve,

Would you consider putting the date you released the manual on the cover page on in the file name. I find keeping track of the current manual is harder than putting the SMT piece on the board!

Thanks for a great kit. Can hardly wait to sit down and build it.

Phil

Hello group
MTR #174 is on the air. I completed a QSO in 20m band with WA9EIC.
I got 549 report with 2w out from a 9v battery.
Some numbers:
With PS :
9v
20M rx 0.034A tx 0.586A ::2w out
40M ::2,5w
12v
20M :: 3,4w
40M :: 4,6w

...maybe a little lower PO, will continue checking.
I really enjoyed building it. It is a great qrp rig, thanks Steve!.

It probably really doesn't matter on this rig as the connections are pretty
short. Just so long as everything stays consistant, one way or the other.

Topic: 10857 Message: 10864

You should see about 400 mv peak to peak. Since you can hear a tone a little bit which changes freq with the tuning, the DDS is apparently working. There is either a short or an open some where between the DDS filter and the product detector '612. Check for shorts to ground in the IF filter, soldering to the mixers, etc.

Steve KD1JV

Hi Steve and all,

Finishing up my 1st run MTR here and making some adjustments, but ran into a potential problem. I'm at the step "local oscillator frequency trim and BFO adjustment". Using an o-scope connected to TP2, I get 2.5vdc with a very small audio AC component (20mv). Should the DC signal change as the frequency sweeps through the passband or is it the AC component that should change? Neither appears to change on my sweep test, even when changing the tone by a factor of 1.5khz (far outside the 500hz filter bandwidth). I do hear a low volume audio tone in the headphones that changes in frequency and all my voltages checked out as good on the audio chain ICs.

Also, is the 20mv AC signal I'm seeing typical or is it low?

Thank you,

Tim

You'll love it Keith, just take your time building!
My first two QSOs with it were Estonia and Germany on 40m!
Amazing for the rig's size, and so much more than my Rock-Mites.
I was going to take my KX3 camping in a couple weeks, but will take the
MTR instead, much lighter..

Gil.

Glad you have got your MTR sorted Gil. Thanks for the beta testing :)

I'm patiently waiting over here in England for my MTR to arrive.

Just for interest, I weighed my original MTR s/n #131 a few evenings ago. My complete MTR rig weighs 2.8oz. I run my MTR at about 2.5w using a 1000mAh 2S LiPo. My LiPo weighs 2oz (fully charged :)), so thats 4.8oz for rig and battery.

What's amazing is the fact that not only is the rig superlight, it is also a fantastic performer. I love the RX, it makes very easy listening. I had my FT817 out a couple of days ago, I found the RX was not as easy to listen to as the MTR, it just seems to have far more mush in the background - probably introduced by the FT817 audio amplifiers. I have the Yaesu branded 300Hz filter fitted in my FT817, it's pretty useless without, especially on 40m.

I much prefer the MTR, I think the FT817 will be relegated back to 'test instrument' status when I get an MTR for 30m up and running.

72,
Colin M0CGH

Interesting Colin... The RX on mine is great, but the noise level seems
a bit high.. Any suggestion as to what could cause that..?
I might be a bit spoiled by being used to the KX3 though..

Gil.

10871. 2nd run MTR firmware

Ok... I am sure some of you have been down this road.

I did it the hard way. I did not want to drill a bigger hole in my ATS-4 or my new MTR case. So I went with the Phono jack and made a pig tail (maie phone to female BNC). It worked fine.. ugly but no problems at all.

Now I am in the process of building up my MTR and was going to make another pig tail. On a whim I stopped by Radio Shack and was asking the guy where the parts I needed were... and he held up a RCA (phone) male to BNC female adaptor and asked, "will this work?" Eureka!!! I never even bothered to do a search to see of they made such a critter. (<7$)

So if anyone besides me wonders if they do... YES they do. It plugs right in and looks very nice as well as provides a solid connection.

For me - that is just one more adapter to lose and prevent me from operating after a 3 hour hike and a 3000 foot climb. Or worse, have it fall between the cracks of a few big rocks, just out of reach.

I put in a BNC on my radio, so it matches everything else I have, then no problems forgetting anything. Well - at least not that.

I hope to start on my ATS-4a kit that I bought ages ago, soon. I checked Digi-Key, and they have an RCA to BNC adapter for $1.99. Part number is 367-1012-ND. But I'm interested in just putting a BNC on my kit. I have a step drill bit so I can widen the hole easily. Can you recommend a specific part for the jack you used? Or will any old chassis BNC fit?

10879. Use the right manual: MTRmanual42012.pdf vs MTR_2.pdf

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-04 04:08:50 UTC
From: jgaffke
Topic: 10879 Message: 10879

Be sure to use the right manual, MTR_2.pdf is only for those units
shipped in 2013. Here's the changes I noticed in the schematics.
I doubt any of these would change the performance much:
DDS Filter: C22,C24,C32 values changed
Caps above BS170 FET's: C48,C69,C70 values changed
AGC: R45 added, C42 connection to U2 changed
Sidetone: R28 now 22k for louder sidetone (mine's plenty loud)
Transmit filters: All caps changed, L13 for 40 meters now 20 turns
The old schematics shows ADS9834 pins 3,4 tied to 5v, they are
actually tied to 3.3v exactly as shown in the new schematics.
And of course, the obligatory mod wire moved over a bit.

I've always been unhappy with using RCA/Phono jacks for RF. They are designed for audio after all. Are they 50 Ohm? We are trying to maintain an impedance match from the rig through to the antenna feeder. If the connection isn't close to 50 ohms then there will be an RF visible discontinuity with associated bad effects on the SWR.

Also, they lack positive latching, I'm always worried they will disconnect at a critical moment.

I doubt the discontinuity presented by a phono jack
has any measurable effect for a wavelength of 20 meters.
SMA's are good to 10 GHz+, but cost real money.

There are no changes to the firmware. I was thinking about deleting a few things like the Pocketdigi routines, but decided I had best leave well enough alone.

You can't. Saving the current keyer speed also saves all the setting in RAM, like the current operating frequency for each band.

Steve

How do I save the current keyer speed without changing anything else?

I've used SMB connectors with my ATS kits. They are a small robust push-on coax connector.

I was able to get some surplus male connectors that I soldered on the board. I also found RG-174 cable assemblies with SMB female connectors. The outer diameter of the cable connector boot was 1/4 inch so I drilled a 5/16 inch hole in the side of my Altoids box to access the male connector. I installed a BNC connector on the other end of the coax.

I got these surplus at a hamfest years ago. New connectors are not cheap but you can find bargains on Ebay. The SMB cnnectors are commonly used for GPS antenna installations.

Hello Sir,

That is fine.. The manual just wasn't very clear on the procedure.
When I select "P" with the menu button, I get "mfo","mdo" (if I remember
well, not home to test now). I click on Fn to save, but it doesn't seem
to let me. Sorry, again, not home to test..

So, here is my question rephrased: From normal operation, what are the
steps required to save the transceiver state?

Thank you.

Gil.

All "new" OMs,

When I was growing up and learning terms, all the radio jocks at the time referred to "male" connectors as "plugs", and "female" connectors as "sockets". Now, it's all gone to the computer vernacular, and I'm really curious, does anyone recall the "plug and socket" days?

Good to know that such tiny connectors are available, I'm hesitant to use BNC on my kits!

73's, grin a lot,

All you got to do is read the manual. Fn and RIT escape the mode. Tune up toggles between Morse ennunciation of freq on or off, Tune down button stores.

NAQCC Sprint Tuesday night!

Our April sprint is this coming Tuesday evening local time (April 09, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Wednesday April 10, 0030 to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201304.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prizes page on our website.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6610+ members in: All 50 States - 9 VE Provinces - 93 Countries. Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

The MTR kit doesn't come with a cd.

The text referring to the cd is cut and pasted from an older manual.

Not sending out a cd with the kit is beneficial in two ways

1. It helps to cut costs, hence keeping down the cost of the kit

2. It's assumed that everyone has access to the internet and thus you can always have access to the most up to date manual.

Hi,

I am fortunate enough to have an unbuilt MTR, batch 2 kit. But I already have an MTR from the last run.

What I don't have is an ATS4.

Is any interested in trading my unbuilt MTR kit - or the built MTR which is in a great Apple Mouse case and built for 20/40 for an ATS4? I would prefer an unbuilt one.

We can adjust the money.

10897. MTR SMT Capacitor Confusion

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-06 03:03:46 UTC
From: Rob Steenburgh
Topic: 10897 Message: 10897
Attachments: 2 described; binary payloads are missing from this source WARC

Before I start building the MTR, I sat down to inventory the parts and had no difficulty with the resistors, inductors and solid state components. However, I've struggled to inventory the SMT capacitors. I've been told I've got some color vision issues, so that may be a contributing factor.

I've attached two pictures. One picture shows both the caps I think I've been able to positively identify and the leftovers. The second picture shows the leftovers.

Can anyone help me assign values to the leftovers? There seem to be a bunch.

Thanks,
Rob

Rob- The number of capacitors in a strip can sometimes be used as a clue to the color code. Label the strips that you can easily identify and this will help to evaluate the remaining strips.

A DIY capacitor/inductor tester has been very useful for measuring capacitance. However, some sort of holder needs to be fabricated to handle the small sm caps. My holder consists of small pieces of one-sided copper clad board that are glued to the tips of a small spring clamp. Wires are soldered to each board, and are used for test leads. Maybe you can come up with a better method. Measurement usually must be made before components are mounted on the board.

There will be a few unused band-specific components left over. However, Steve has been very accurate in providing the correct number of components.

You might consider some method of marking capacitors as you remove them from the paper strips.

Hope this helps a little.

10899. Connector Nirvana with the ATS3A

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-06 05:19:09 UTC
From: jgaffke
Topic: 10899 Message: 10899

I have an ATS3A and an MTR. With the MTR, the connectors were pushed off the board to make room for two bands worth of switches and filters. Two bands on the main board is nice, but I must say I really liked the connector arrangement of the ATS3A. Especially once I hacked in a CUI PJ-032H-SMT-TR power connector (mates to CUI PP-012) to serve for the antenna as shown in folder KE7ER in the photos section. I soldered the connector down on the opposite side of the board where I found some unused copper. With all connectors on one edge of the board and no wires to break and no connectors to unbolt from the panel, it's a cinch to work on the rig. The RF output stage has a DC blocking cap, so no problem if the power and antenna plugs go into the wrong jacks. Those worried about the impedance of antenna connectors will undoubtedly shudder when they see the photo, shows a 3" long twisted pair back to the filter section. Works great, though even I was looking for some small coax.

Also, the ATS3A had an earphone connector with the barrel open all the way through to the back. I found I could move a couple parts immediately behind the earphone jack to make room for a very small microswitch, such that power would be turned on when the earphones were plugged into the rig. Required the addition of a piece of plastic ballpoint pen barrel since the earphone plug was not quite long enough to reach the switch. Never did glue things in place since I didn't want batteries inside anyway, leaking all over my precious little rig.

Hi,

I am color blind too even if not "100%" like my grandfather was.
I had no doubt in making the inventory for my MTR first run.
Using the numbers of items was easier than the color code.
I know several parts values have changed in the second run, but I think you can narrow things using the numbers as Wendell suggests.
Anyhow, you are right in the thing you have to take it easy and check things twice before starting to solder.

Enjoy building!

A few comments on the jacks of the ATS3-B specifically (since not sure they were the same through the ATS3's)...

Several friends of mine and I have used these radios for SOTA activations. While mine have not suffered a failure, in fact, a jack failure has proven common. What seems to fail is not so much the jack, but that the jacks are soldered to traces on the board, and the thing is only as sturdy as the weakest link. ALL of my friends have had a jack fail, either a power jack or the phones jack or the paddle jack with the traces pealing off the board.

i MUCH prefer these jacks off the board. never had a failure of the jacks off the board, and if there was a failure, it wouldn't damage the board.

Those things said, the on/off you refer to is very clever. I mount my battery inside the case with my MTR. I don't leav it there, just travels there. I would like to figure out an on/off switch, rather than opening the case and plug in the JST, but it needs to be something that can not possible turn itself on in the backpack during the carry.

No, those files are now in the group file section. The problem with re-using
old manuals so everything doesn't have to be rewritten is sometimes
references which don't apply don't get deleted.

Hi All,

I just had a bit of a panic, but all turned out OK in the end.

I started building my MTR today, placing the semiconductors by hand. I fitted D1, the one in the 'yellow' marked carrier. In the manual it states that the markings for this device should be 'A7'. I was checking over my work and I noticed that the 'yellow' device that I had fitted for D1 was marked 'KJE' and Y5.

It turns out that 'KJE' is an alternative code for the same type of device, so all is good. 'Y5' would be the date code for time of manufacture.

The moral of the story -

Don't panic if your D1 doesn't say 'A7'!

10909. Re: Connector Nirvana with the ATS3A

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-06 21:25:25 UTC
From: jgaffke
Topic: 10899 Message: 10909

Fred,
Very good to know about breaking traces on surface mount connectors, perhaps a good argument for making room for through hole connectors. I haven't had a failure on my ATS3A yet, but that is how many of my portable broadcast radios have failed over the years.
I got an interesting reply to my previous post via email from Harry, OE6GC. In it he says: "Take one small P-Channel MOS FET like the IFR7205, connect source to the battery, drain to the rig, 100k between source and gate, 47k from gate to one headset pin. If you insert the headset this will route the battery to the ATS Rig."
The MTR already has a PFET in the power lead, rigged to act as a low dropout diode to protect against reverse polarity accidents from the battery. Unfortunately, that PFET is wired up in reverse of what is needed for our power-on trick since it has an internal diode from drain to source. If we switch the drain and source leads of Q6, tie the bottom of R24 to the headphone jack instead of ground, and add Harry's 100k resistor from source to gate, that should mostly work. Except it will take a few seconds for that 100k to charge up the 33uF cap at C3 enough to shut down the rig and we lose the diode protection originally provided by Q6. The source to gate zener D2 would help reduce that delay, and we could reduce the 100k to down as low as 10k if we are always running from a battery of 10 volts or more. We probably want some sort of indicator to show that the rig is on, perhaps by having the MSP430 occasionally flash an LED segment.
Jerry, KE7ER

I hate when they do that to me. I must have got a different manufacture this time. You just have to trust I put the correct color on the correct part :)

Thanks Wendell and Yan.

I am an idiot.

As Jerry (KE7ER) noted in his post
<http://groups.yahoo.com/group/AT_Sprint/message/10879> , using the
correct manual is important. I had the right manual to begin with, but
when Steve posted an update
<http://groups.yahoo.com/group/AT_Sprint/message/10855> , I downloaded
it again so I'd have the most correct version. Only, I didn't download
the manual for the MTR-2
<http://f1.grp.yahoofs.com/v1/PJlgUTZBFlO3bljL9lmjZiqqtYOdmXoVgswh1sS5U0\
OJOqd86e2QYY-tkxArHopnL4-YFTZQt59j1bz8cUYfaGjmf-QD2Rc/MTR%20/MTR_2.pdf>
; I downloaded the manual for the original MTR.

I've been trying to reconcile the parts for the second MTR with the
parts list for the first MTR. [Note: that doesn't work well.]

Now with the correct parts list, everything matches up perfectly. Part
counts are spot-on. Go Steve!

It turns out I'm not as colorblind as I have been told, mostly by my
wife, but using a capacitance meter helped confirm my suspicions.

I still don't think mauve is a color. It sounds more like an emotional
state. "How are you feeling?" "Oh, lately I've been kinda mauve."
[I didn't win that argument, either.]

Back to work!

10912. MTR 2 33 pF cap color marking

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-07 00:10:18 UTC
From: scottg720
Topic: 10912 Message: 10912

The parts list on page 5 shows the 33 pF cap color as GRN/GRN/BLK but on page 9 it shows ORG/ORG/BLK. I initially thought I had an extra ORG/ORG/BRN (330 pF) but I now realize the correct color code is ORG/ORG/BLK (measures 33 pF).

I don't think this has been mentioned on the list so I thought I'd share. If it has, I apologize for the bandwidth.

From: f4gha
Topic: 10922 Message: 10922

Hi All,

I'm waiting for my MTR N° 47 from the second Run. I hope to receive him very soon despite the fact that the FY postal services are catastrophic...

I plan to be active on /P and maybe on the IOTA SA-20 with my MTR and a Buddipole antenna. But also at the station for Fun. Bands will be 30 and 20m.

Could I have some feedbacks from those have used their MTR during a Pile Up ?
How the device behaves when many people calling you at the same time ? Is it possible to easily extract a Call or the receiver is submerged ?

I ask this question out of curiosity because future conditions are probably too small to make myself understood by many people and generate a big pile up. But you never know ! Hi

Thanks in advance.
Best 73 to all this great group.
Loïc, FY8PE.

10924. MTR low out on 20m

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-09 00:57:20 UTC
From: jonesr_99
Topic: 10924 Message: 10924

Just finished number 87, all went well until testing with a dummy load.
Receives well on both 40m and 20m, with 12volt supply it outputs 5 watt on 40 but only 2 watt on 20. In Tune mode I get 55v p to p at top of D4, on 20m the scope shows 59v p to p. Could this low out on 20 be something in the low pass filter? Wrong capacitor? I double checked the number of turns thru the toroids as well as wire spacing. Any tips would be appreciated.

Topic: 10926 Message: 10926

Hi all,

received my SN264 yesterday, spent 8 hours building & 2 hours troubleshooting my mistakes (while XYL had other plans for the night, oh well...).

First QSO with my brand new MTR was today with Gary, KF7WNS. Not bad - that is some 10000km or more (however, lost him in the middle of QSO, but reports got changed).

Got also PFR-3 here, I much prefer the RX of MTR in comparison to PFR3 which at least in my case is a bit too narrow/selective to my taste.

Getting now about 2W on both 40m and 20m bands at 12V point, so further adjustments and tuning will take place later - however, it's just couple of dB from the max, so personally I don't care much really as long as the precious power is not wasted in heating the enclosure.

Kit was a delight to build, one of the better ones I've done, I enjoyed it lots - and more enjoyment to follow now that I can operate it. (However, I changed the power and RF connectors to match with my other gear for compatibility)

Thanks lots Steve and cheers from New Zealand,
Riku, ZL1KLP

Hi Loic,
I think you'll be pleasantly surprised at how good the receiver is in this little rig.
I'm sure you'll have bigger pileups than I'm likely to have, but at the start of a SOTA activation I may have 10 - 20 callers all calling at once.
The trick is to select RIT and listen above and below the frequency to pick them out. The receive bandwidth is actually very narrow with steep skirts and good rejection.
You can hear a bit of what I get if you listen to the videos here which have audio captured from the MTR.

From: Gil WA5YKK
Topic: 10908 Message: 10933

Steve, et all,

Allow me to shift the focus of the group for one item that is confusing. I'm trying to find "genuine copper strand speaker wire", the type that Rad Shacque used to sell in bulk, now I look at Internet references and am aghast at the fact that we often by copper clad aluminum wire! It took half an hour to find a source of real and heavy copper wire, got a lot of projects to play with for my speakers, and copper clad won't do the job, my salt air component in my environment causes early failure, the copper goes bad, then the aluminum turns to dust. There is no fooling Mother Nature, that plain ole physical chemistry does the same thing now as it did when I first had problems with a soldered connection!
Anyone who knows of an outfit that handles the best wire, kindly reply to me directly, off the group listing.

Thanks for the bandwidth,

73's
Gil WA5YKK (Someday, I'll get all the ATS rigs going!)

10934. What determines band?

Date: 2013-04-11 07:39:02 UTC
From: f_skinner
Topic: 10934 Message: 10934

I completed my MTR, I built it for 20 and 30 meters or so I thought. I have low power output on both bands (around 1 watt) but what concerns me is instead of 30 meters it is transmitting on 40 meters and the band indicator for band 2 is a "4" so it does not go to or see 30 meters at all.

Is there something additional I need to do to get 30 meters? Since I wound everything for 30 and used the resistor and cap values for 30 meters I am thinking that would explain the low power output but I need it to be on 30 meters. (20 meters is set as BS1 (10K resistor) and 30 meters as BS2 (22K resistor)).

I just went through and checked all the values on the resistors for bnd b (I cannot check the caps) and re-counted the turns on L12 and L13. I am not sure what to do next.

Thanks for any help

Frank....

Sorry I'm on my phone right now and can't refer to the manual, but there is a "band select resistor" for each band that tells the CPU what band should be used. You may have a wrong part there, or possibly a bad solder connection.

Lee, yes, that was my first thought but I checked them several times and ensured no bad connections.

(20 meters is set as BS1 (10K resistor 103) and 30 meters as BS2 (22K resistor 223)).

Frank....
Sorry I'm on my phone right now and can't refer to the manual, but there is a "band select resistor" for each band that tells the CPU what band should be used. You may have a wrong part there, or possibly a bad solder connection.

Does the voltage on Pin 20 of U10 (the microprocessor) change when you switch the band switches? The resistor circuit goes go via S5b.

Are S5, C67 and R41 all soldered correctly without any shorts or opens?

switch the band switches? The resistor circuit goes go via S5b.

Yes it does change. The radio will switch to 40 from 20 and back. It has not had a problem
switching bands at all. Of course I built it for 20/30 meters.

Are S5, C67 and R41 all soldered correctly without any shorts or opens?

I just checked and re-solder them all, no effect.

Thanks for the suggestions Colin.

Another thing to check, you mentioned that the output power was lower than expected. Well pin 19 on U10 (the micro-controller) is part of the Tx control circuit. Please check that pin 19 and pin 20, which is the band select input, are not shorted to each other.

I'm also building for 30m and 20m. I'm hoping to be ready for a smoke test this evening.

I'll have to see how my rig behaves and I'll report back.

10942. MTR ver2 layout errors

Yahoo group: AT_Sprint (2012 — 2013)

From: paradoxpete.pdm@...
Topic: 10942 Message: 10942

I've just started installing the resistors on the bottom side.
The resistor layout shown in the latest manual is not correct around the area of Q4/Q5.
R26 and R27 are 2.2k and not in the positions shown (use screen printing to determine their position). Also D3 and R30 do not line up with the layout drawing. I'm assuming this layout is for the ver1 Board. The photos of the topside both show two different layouts too.
Apart form that all going well!

My MTR2 was built for 40/20 meters. It was all right on 20, but it would go to 80 meters rather than 40. Band selection is via R3 and R4, and obviously R4 at 47K wasn't doing the job. I replaced it with a 33K resistor, it correctly went to 40. Band switching resistors might be the source of problems for other rigs/bands.

The schematic on page 22 has an error. It shows the band switch resistors going to the wrong place on the following page. This connection should be to pin 20 of U2, as correctly shown on page 23.

Good luck

I've been having a similar issue...My MTR2 is being built for 40/20 and seemed to switch fine, but after some un-related fiddling, it started giving me 80m . Flipping all the band switches back and forth half a dozen times seems to have fixed it, but I think I am going to pull my band switches out and test them.

(My unrelated fiddling is to do with plenty of power out on 20m and nada on 40m...I am thinking my bandswitch for the filter/antenna is not working correctly...)

Frank,
When I modified my original MTR for 60 m I had a similar issue. It was originally a 40/20 rig and yet when I switched to 60 (in the old 40 position), it displayed 6 but still tuned to 7 MHz.
I eventually discovered that this was because the defaults for band 1 in memory were for 40 metres. I went into the settings menu and did a reset. It then picked up the new band settings which I then saved in the preferences. Is it possible that the processor has been programmed with defaults of 40/20 and needs resetting?

Hi Frank,

It would appear that this is an issue with the kit, rather than a build problem.

I have just completed the 'smoke' test, happily the smoke didn't appear!

My 30m / 20m build is also showing operation on 40m and 20m.

Is this a firmware fault perhaps? I could maybe try some different values of band select resistor to see if I can trigger a '3' in place of my '4'.

Right now though I'm tired, I'm off to bed!

so you're not alone, my rig is exactly the same.

10949. MTR Build - 612 chip Pin 1 Help?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-11 22:11:45 UTC
From: Etienne Scott
Topic: 10949 Message: 10949

I'm laying down parts on the bottom side of my MTR board.

Getting to the 612 chips - and I cannot see ANY pin 1 identification. No dot, no notch.

Any help here? Are there any other chips like this?

(And the 40Mhz osc has a pretty sad little dot not really in the corner.)

Etienne, Steve notes this particular chip in the build notes as it doesn't have a dot. You can use the makers logo for the dot 'nxp'.

One other way to tell is to look at the sides of the chip casing, one side will have a bevelled edge. The side with the bevelled edge has pin 1 on.

Hope this helps, I think Steve explains it better in the manaul!

Got it, thanks!

The bevel is very subtle. Need the loupe to see it, the hand lens isn't quite enough.

The bevel is addressed in general in the manual - I was looking for advice for the 612 in particular and there isn't any.

Onward!

Hi Colin, well I do not know if I am happy about that or not. I sure am sorry your having the same issue. I have decided not to mess with it today as it has taken up too much of my time already and it stopped being fun late last night.

I learned how to "melt solder" which I had never done in the past so at least it accomplished that and it is a very cool process to watch. Since I wanted to use this radio for minimalist SOTA activations this summer I will wait until one comes up for sale (built and working) regardless of the band configuration.

I do appreciate everyones effort to help me troubleshoot.

Don't give up Frank!

The MTR is a cool radio! My 40m/20m MTR is my favourite SOTA rig, I really love it, that's why I bought another!

It seems from your description that your build job is just fine.

A solution will appear and we'll soon be working DX on 30m. I've been using a RockMite on 30m up to now, sure it's fun working across the pond with 400mW, but it will be nice to just hear the replying station and not the entire band!

I think I'll have a rest day tomorrow I've been building the MTR in short sessions since Saturday.

From: Joseph Trombino, Jr
Topic: 10955 Message: 10955

I'm getting ready to start building my new MTR rig.

Believe starting out with the bottom of the circuit board is a good place to begin....I'll do the complete bottom and then finish up with the top of the board components.

I wonder if others have done the same thing or is this not a good way to go??

> stopped being fun late last night.

Someone mentioned fixing this on a 60m modded rig. It seems that if
the bands are not the "standard" pair then the rig miss-remembers the
initial frequencies.

The fix was:

1) Select the problem band.
2) Perform a power on reset per Page 21 of the manual
(Hold menu button down while powering up)
3) Save user preferences using the 'P' menu option and 'Tune Down'
(also on p21 of the manual)

I'd be interested to know if this procedure fixes the problem.

Also, Steve will probably respond soon, I had a reply from him on
another query yesterday saying he was travelling at the moment with
little Internet access so it may take him a while to catch up.

Colin,
That is exactly what I did with mine when I converted to 60m (and it still operated on 40)

If I remember, after delving into the code a little, it retrieves the settings on power up from the user preferences.
I seem to remember it sets a flag to always do so "if calibrated".
To force the flag to "not calibrated" you need to do the master reset described and then then when the band switches are scanned the new band values are loaded.

I'll let you know if it works for me as 30 is in my latest rig (maybe get to power up today!)

Thanks Pete,

I hope that fix works!

Today I've left my rig alone, I've started build on a 40/20 version.

Waiting for your results / waiting to try your fix tonight.

I know the bandwidth is 500hz, like it said in the manual.
But it seems the receiver performs extremely very well against QRM and QRN, because on the videos signals are pure and perfectly understandable. Like if a narrower filter is employed.

I am very excited to receive it !

10962. Re: MTR and Pile Up

Understand that I have 55 yrs of experience in CW ... I have been easily able to handle pile-ups with the MTR. Considering that it is a XCVR that weighs one and a half ounces, and draws 35 MA on rcv, its dynamic range is very good. We have been able to operate two of them on the same hill only 30 mtrs apart, and 3 khz apart (yes, can hear him, but not enough to be a bother).

signals sound separate if their fequencies are different, and often copy two or three calls at once.

aka WS0TA

--

Hi All,

I'm waiting for my MTR N° 47 from the second Run. I hope to receive him very soon despite the fact that the FY postal services are catastrophic...

I plan to be active on /P and maybe on the IOTA SA-20 with my MTR and a Buddipole antenna. But also at the station for Fun. Bands will be 30 and 20m.

Could I have some feedbacks from those have used their MTR during a Pile Up ?
How the device behaves when many people calling you at the same time ? Is it possible to easily extract a Call or the receiver is submerged ?

I ask this question out of curiosity because future conditions are probably too small to make myself understood by many people and generate a big pile up. But you never know ! Hi

Thanks in advance.
Best 73 to all this great group.
Loïc, FY8PE.

Am getting this a few days after you sent it so you may have it running well by now, but can say that unadjusted, this is not a surprising output to me. Play with scrunching or spreading toroid turns while monitoring that ouput. AFTEr adjustment I get 4 watts out at ten volts, and 5 watts out at 11 volts. Only 5.5 watts out at 12.5 volts, so I find that voltage higher than 11 not worth doing.

Subject: [AT_Sprint] MTR low out on 20m

Just finished number 87, all went well until testing with a dummy load.
Receives well on both 40m and 20m, with 12volt supply it outputs 5 watt on 40 but only 2 watt on 20. In Tune mode I get 55v p to p at top of D4, on 20m the scope shows 59v p to p. Could this low out on 20 be something in the low pass filter? Wrong capacitor? I double checked the number of turns thru the toroids as well as wire spacing. Any tips would be appreciated.

Thanks for your reply Steve.

That's not the issue here, the rig seems to wake up after moving the switches with any user input, whether that is a button press or you close a paddle contact.

The problem is that for some reason the processor is not recognising the band resistor for 30m and the rig defaults to 40m with the switches to the left.

Switching back and forth to 20m works as normal.

10970. How to enlarge and print an image or selected text in Adobe Reader

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-12 17:01:45 UTC
From: c6alk
Topic: 10970 Message: 10970

I decided that I needed larger images of the MTR board to better build the unit. Here is, in case folks don't already know, how to enlarge and print those, or any other, images in Adobe Reader (.PDF files). I copied this directly from the Adobe Web site.

How to enlarge and print an image or selected text in Adobe Reader:

1.) Open the PDF in Adobe Reader or Adobe Acrobat.

2.) (Acrobat X/Reader X) Choose Edit > Take A Snapshot.
(Acrobat 9/Reader 9) Choose Tools > Select & Zoom > Snapshot Tool.

3.) Drag a rectangle around the area you want to print.

4.) Choose File > Print.

5.) Make sure that the Selected Graphic option is selected in the Print Range

area of the Print dialog box.

6.) (Optional) To enlarge the selected text or graphic to fit the sheet of paper,

choose Fit To Printable Area from the Page Scaling pop-up menu. Note: Enlarging

the area reduces the printed resolution.

7.) Click OK or Print.

10972. #257 lives!

Yahoo group: AT_Sprint (2012 — 2013)

From: paradoxpete.pdm@...
Topic: 10972 Message: 10972

#257 was finished abot 60 minutes ago.
First QSO with G3YHO in Norfolk on 40 metres.
He gave me 599. This was using a 9v PP3 battery.
In my haste to call him I forgot to tune my antenna and the SWR was showing 8:1.
The finals survived :-)

This was followed by working T77C on 30m.
He answered on my first call (and he has a pileup running) 599 both ways.
So yes it works on 30 and 40.

Still lashed up on the bench so will attempt to box it up tonight and maybe take it up the hill tomorrow afternoon for a quick SOTA activation.

Hi TJ,

Thanks for this nice proposition. ;-)
I will try to build my MTR for sure ! hi
But if I doubt or have some problems, you will be one of those I will ask for some help.

But, crossing my fingers, I hope it will work at the first time.

Loïc, FY8PE.

10979. 30m / 20m MTR band switch fixed!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-12 20:03:59 UTC
From: Colin
Topic: 10979 Message: 10979

My MTR is now switching beautifully between 30m and 20m.

I simply swapped out the 22K resistor at position R4 (BS2) for an 18K.

I didn't try other values resistor, 18K was a guess.

I'm so happy, I was almost at the point of swapping the bands on the rig to 40m and 30m instead.

On with the build!

Date: 2013-04-12 20:32:40 UTC
From: russellhulett
Topic: 10981 Message: 10981

Based on the messages about part placement, power ouput, and band switching, seems best to wait until Steve returns and sorts out the issues before beginning construction of my MTR? Guessing about July will be a good time to start soldering.

Not an early implementer, I never buy s/n 1 of anything, don't install software until after first service pack arrives, don't build kits until the issues have surfaced and resolved.

The MSP430 measures the voltage at pin 20 to determine which
band has been selected by the switch.

From what Peter says, sounds like the firmware is a mix of
choosing between two bands if calibrated, and between four
or five bands if not calibrated?

Could nail the switch to be either 3.3v or 0v and hack the
firmware to allow the user to select the two active bands
through the switches, permanently saving that selection to flash.

But should just work as is, the MSP430's ADC should have no trouble
distinguishing between four or five different voltages. Very weird.
I wonder if it is temperature dependent?

If I had to tune it, I'd probably hack in a 10k pot to determine
where mid range is for the bands of interest, then substitute in
the appropriate fixed resistor values.

Glad mine just works (on 20 and 40 at least).

I'd go ahead an build it.
At worst you will be changing one or two resistors, and that
seems to be mostly on rigs that are not the default 20/40.

I'd second Jerry's comments, don't be afraid to start building, the MTR is a proven design.

The parts placement is easy to work out using all the available resources, if you get stuck at any point, there are plenty of us on this reflector that can help you out.

The band switching works perfectly on 40m and 20m, so no worries there.

You're missing out on too much fun if you wait until July.

Field day will be over by then! :-)

I usually pluck them off with two soldering irons.
Or could add 100k in parallel with the 22k to get 18k.

10988. Re: 30m / 20m MTR band switch fixed!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-13 03:58:22 UTC
From: jgaffke
Topic: 10979 Message: 10988

I think the values in the firmware are incorrect for
the resistors that get stuffed for 30 and 40 meters.
Dave, VK2DDJ, provided a firmware fix for this, mentioned in
message 9267. His zip file is in Files/MTR/IAR/MTR Flash.zip
There were also some band edge issues, mentioneed in 9375
But perhaps none of this made it into Steve's codebase.
There may be other bugs mentioned in those discussions as well.

If you don't want to mess with loading new firmware, another
solution is to change the resistor values.
I think 18k looks good for 30 meters, and 33k for 40 meters.
This can be had by tacking a 100k resistor over the top of the
existing 22k for 30 meters or 100k over the existing 47k for 40 meters.
This applies to resistors R3 and R4, shown in the schematics
in the lower right of the first sheet of the schematics.

Here's some of the boring details:

Look at the code in the Files section under MTR/IAR/MTR_2.s43
Date on the file is May 14, 2012, so I assume it was built for the
first run of MTR rigs, and that the second run of rigs take exactly
the same firmware.

Looks like the 10 bit ADC is set up to continuously read the voltage
at pins 20 (band switch) and 19 (battery), leaving the 10 bit result
at memory addresses adrst0 (band) and adrst1 (battery).
The ADC is configured to use an internally generated 2.5 volt reference
voltage for the highest ADC value of 0x3FF, and 0 volts in gives 0x000.

The section of code labeled "band:" uses this algorithm:

Read 10 bit ADC reading of pin 20 voltage from RAM address adrst0,
If reading >= 0x3a0 (2.27 volts), then band is 80m
ElseIf reading >= 0x2a0 (1.64 volts), then band is 40m
ElseIf reading >= 0x200 (1.25 volts), then band is 30m
Else band is 20m

For example, the 80m comparison value is 0x3a0 hexadecimal, or 928 decimal.
If all ADC 10 bits are 1's for a full scale reading of 0x3ff, thats 1023
Since full scale is 2.5 volts, a reading of 0x3a0 is 2.5v*(928/1023) = 2.27v

(With VK2DDJ's fix, those values are adjusted to 0x3ec, 0x30a,
and 0x207 respectively. If you make Daves firmware change,
you should not change the resistor values. I have not verified
Dave's values.)

The resistive divider between 3.3v and ground as selected by the band
switch gives the following voltages into pin 20 for stock resistors:
3.3v * 100/(22+100)= 2.70v for 80m
3.3v * 47/(22+47) = 2.25v for 40m
3.3v * 22/(22+22) = 1.65v for 30m
3.3v * 10/(22+10) = 1.03v for 20m

The voltages for 80 and 20 look good.
The values for 30 and 40 are right on the cusp of flipping between
the two adjacent bands.

The easiest fix now with several hundred rigs out there would be
to change the resistor values rather than the firmware.
We want the R4 value for 40m to give a voltage about halfway between 1.64
and 2.27v, or 1.95 volts. The R4 value for 30m should put the voltage
halfway between 1.25 and 1.64v, or 1.45 volts.

For those that want to wade in further, here's some comments I created
to figure out how the ADC gets initialized. Only weird thing is,
it gets set up to read channels A0 through A4, but only channels A3
and A4 get used. Vref is the internal 2.5v voltage reference,
it does not an external pin in this case.

The ADC reads the highest channel first (A4) and writes the result
to the lowest memory location (adrst0), which might be a bit
counterintuitive.

ADC10CTL0: 3cf0: 001 11 1 0 0 1 1 1 1 0 0 0 0
001: Vr+=Vref+, Vr-=Vss
11: 64xADC10CLKs sample and hold time
1: Ref buffer drive suitable for 50 ksps
0: Ref output off
0: Ref buffer on continuously, not just during sample
1 samples taken continuously
1: 2.5v ref generator
1: ref generator on
1: ADC10 on
0: interrupt disabled
0: no interrupt pending (set when conversion complete)
0: ADC10 conversion disabled
0: No sample and conversion start

ADC10CTL1: 402e: 0100 00 0 0 001 01 11 0
0100: A4 is highest input channel for sequence of 5 conversions, 0-4
00: ADC10SC is sample and hold source select
0: Straight binary (not 2's complement)
0: Sample input signal is not inverted
001: ADC clock divided by 2
01: ADC clock source is ACLK
11: Repeat sequence of channels, so continuously convert
0: ADC10 not busy

ADC10AE0: 0018: 1 1 0 0 0 Turn on ADC inputs A4, A3 at pins 20, 19
ADC10DTC0: bitset #ADC10CT, for auto data transfer mode
ADC110DC1: 0005: 5 data transfers, start from top and work down
ADC10SA: 0x240: Start RAM address, band is adrst0 and battery is adrst1

Yes, I seem to remember something about this when the first run kits appeared and I thought Steve fixed it - wasn't that what the "yellow dot" processor chips were for?

> Dave, VK2DDJ, provided a firmware fix for this, mentioned in message 9267.

There have been a few firmware updates suggested, incl mods for 60m band operation.

> If you don't want to mess with loading new firmware, another solution
> is to change the resistor values.

I think that it's probably best to tweak the firmware values a little bit so that rigs built to the current design work more reliability, but to also change the resistor values as you suggested.

Quite a few of the MTR builders have bought TI Launchpads for programming the board so it ought to be reasonably easy for people to find someone close to them to get their rigs re-programmed, maybe by post in some cases.

For those in the UK who want their rig updated I have a Launchpad and can help.

It should be possible to change the firmware enough to make existing rigs work and also have it work with the new suggested resistor values too.

> it gets set up to read channels A0 through A4, but only channels
> A3 and A4 get used.

I think you might have to set the A/D in groups (of 4), my ref book
isn't to hand atm.

I'm still building the first run MTR kit I only got recently but I
intend to do some playing with the firmware once it's running, mostly to
use 60m. I may spend the time to bring all the various mod proposals
together and issue an updated version like I did with the firmware for
the ATS-3B

Thanks for the offer of help and all the info Colin.

I believe I am sorted now.

The yellow dot firmware update was to cure the original firmware's habit of transmitting the menu feedback announcements over the air rather than just locally to the headphones.

The new MTR kit uses the 'yellow dot' firmware - if it ain't broke, don't fix it!

10991. Source for 18K SMT resistor help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-13 13:27:21 UTC
From: f_skinner
Topic: 10991 Message: 10991

In my quest to find a 18K resistor to be able to use my MTR on 30 meters I am getting confused when searching the Mouser Electronics web site as to which SMT resistor I should get.

http://www.mouser.com/Passive-Components/Resistors/_/N-5g9n?P=1yzeg25Z1z0z7ym&SAP=true

I am just not too smart on these things so if someone could clue me in so I order the right resistor I would appreciate it greatly. I figured I would order a few of them for other people that run into the same issue.

Thanks in advance
Frank

Frank,

Only important thing is the size. Steve uses 0805 resistors,
meaning they are 80 by 50 thousands of an inch.
I'd tend to go with 1% parts at almost no extra cost.
Here's a possibility, Mouser part number: 652-CR0805FX-1802ELF

If you already have Steve's resistors soldered down, you could
instead tack a 100K on top of the existing resistor for R3 or R4
to select 30 or 40 meters: 652-CR0805FX-1003ELF

There's a couple hundred rigs out there working with the
current firmware, mostly no complaints. I want to emphasize
that with this resistor change (and in most cases without it)
the MTR is plenty good enough.

Frank-
I have an assortment of sm resistors, slightly larger than those in your kit. Let me know if you need a couple, and I will send them to you.
If you plan to do much kit building, assortments of resistors and capacitors are comparatively inexpensive. However, be aware that there are several physical sizes.

10996. MTR #267 alive! :-)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-13 20:21:06 UTC
From: Colin
Topic: 10996 Message: 10996

I've just calibrated MTR s/n 267.

My MTR is built for 30m and 20m, from a 9v PP3 battery I'm showing 3 Watts on 30m and just a little less on 20m, around 2.5 watts.

Another MTR is born!

10997. How to check for key clicks

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-14 04:25:16 UTC
From: XV4Y
Topic: 10997 Message: 10997

Hi,

This question is a bit out of topic.
Several things, including the fact that "portable" is not allowed in Vietnam, do not allow me to do SOTA operation like most of the ATS/MTR owners must be doing.
I am mostly using my MTR during power cuts (on battery) and at my in-laws farm.
Since I have no real weight restriction, I have been thinking about adding a little more power to this small jewel.

3 years ago I found several reformed amplifiers in a flea shop in Saigon.
They are 2SC2290 push-pull working under 15V. With 12W and 10W I have 100W out on 14 MHz, less on 10 MHz, a little more on 21 MHz.
Hooking my MTR to one the amp input, I have 55W out for 4W in. Perfect.
I have check the signal shape on a scope and it is a beautiful sinusoid, no signs of harmonics so far.
I have added a RF sensing circuit and a RX/TX switching circuit. It works very well so I am ready to go.

However, since my next portable operation is in May, I have a little time check things.
I would like to see if my RX/TX relay is switching fast enough. The RF sensing circuit (borrowed from ON6MU) should detect signals under 100mW, but I am concerned by the realy by itself.

I only have in hands an analog scope Iwatsu SS-6122. I bought it used 4 months ago and it is a very longtime since I have played with scopes.
I have tried to put the RF signal to Channel 1 and my paddle to channel 2, driving the Trigger with channel 2 but it does not work as expected.

Is their a way to do such measurement with an analog scope or do I need a DSO ?
Please give me any advice you think relevant...

Thanks by advance.
73,
Yan.

Yannick,

Triggering on the keyer paddle will only allow you to see the
very first rising edge. You would do much better triggering
on the gate of Q4 (a square wave between 0 and 3 volts)
while sending a string of dots with the paddle.

What did not work as expected?
I'd guess you are having trouble getting the scope to trigger
properly. Triggering mode should be set to "normal" on "rising
edge", and adjust the triggering level so it is in the middle of
the triggering signal. Turn on the display for channel 2 while
adjusting the trigger so you can see what you are doing.

That's a 100 MHz four channel scope. Should be a very fine
choice for work around HF radio.

You're on the right track, triggering on the keying line
while observing the RF output. Should see the signal envelope
rise from zero to full power in about 5 milliseconds. Set the
horizontal sweep rate to around 1 millisecond/div.
Since the relay won't turn on at zero power there will be an
initial step in the envelope when it first turns on. Should be
OK if it's under a watt or so. You also want to check the
falling edge of the signal envelope (trigger on Q4 gate falling
edge) should decay back to zero in 5 milliseconds. The MTR
sends out a very nice trapezoid.

Hi Jerry,

Thanks for confirming me that is possible.
That's what I was doing, or at least I thought so. The trigger was in AUTO.
I tried Q4 too but did not want to fiddle too much with the MTR itself making a short or so.
I must admit not having the oscilloscope user's manual I am sometime lost in the trigger settings.

I will try again later taking it step by step.

73,
Yan.

Steve,

I'm pretty sure it's this one. I looked at my MTR and the part has C&K stamped on the side. I also checked the pin spacing on my MTR compared to the datasheet.

http://www.mouser.com/ProductDetail/CK-Components/0S202011MS2QN1/?qs=sGAEpiMZZMsqIr59i2oRclJQZtb8Z%2fwa3qNR%2fKy5T70%3d

Mouser Part #:

611-OS202011MS2QN1
Manufacturer Part #:
0S202011MS2QN1
Manufacturer:
C&K Components

JFYI, there is another switch with the "QS1" suffix in the PN instead of the "QN1" I listed above. The QS1 is the shorting version (make before break switch). I don't think you want the shorting one in that way that Steve designed the band switching circuitry.

Scott, KB0KFX

Thank you, Scott! This looks like the item ...donno about the make before break business? But I'll go with your hunch and order this one.

Actually I'm using my new MTR2's beautiful case to install my old 20/40 in. I'll also probably rob one of MTR2's switches to fix up MTR1's broken one then when I get the courage to build my MTR2 I can worry about the missing switch ...Steve wGOAT

11003. U11 in MTR kit

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-14 17:53:38 UTC
From: Joseph Trombino, Jr
Topic: 11003 Message: 11003

Howdy Gang:

I just installed U11 the 40Mhz Osc can.

The board placement indicates a "DOT" in the upper left for pin 1.

Using my OptiVisor I can see a "DOT" under the "T" and to the left of "4" as in TXCB and 40.000.

I took it that this little dot on the can indicates pin1???

It is soldered with the print on the little can vertical...with the TXCB in the upper right.

I assume this is the correct position??

Any info appreciated.

73, Joe W2KJ
I QRP, therefore I am

Dot and print should be oriented just like the AC02 at U8.
Dot is in the corner nearest the headphone connections.

The photo on Page 3 of the manual clearly shows the dot.

Many thanks for the responses regarding the positioning of U11.

WOW!! The dot on the little can is very faint on my part...even using my OptiVisors it is hard to see.

Now trying to work thru the positioning of R26/R27...the parts placement photo appears different from the actual board/silk screening...gonna read the schematic/board traces and solder the parts that way.

I agree that the dot is tiny.

You can probably use the text for alignment also, see the hi res image here - http://www.flickr.com/photos/24901892@N03/8643017189/

Hi Steve,
Just wondering ... what bands did you chose for the second build? I chose 80/30 and got a new case for last years 40/20. It works great with the SOTA Tuner from Hendricks kits and is very light weight. BTW my wife KA1DTU and I met you at the Masscon event about 2 years ago. I was the guy that won the BuddiStick after your presentation.

11009. U9 Orientation - Double Checking - s/n 248.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-14 20:26:08 UTC
From: pswarman
Topic: 11009 Message: 11009

Could someone please confirm to me the correct orientation of U9. I've seen the manual note about it being upside down (using the letters on the chip), but the layout diagram on page 7 shows CC5R the other way up. The dot on the chip, if I'm seeing it correctly, is so small that I'm uncertain it really is one.

I've started to solder the chip using the orientation on page 7 but I've stopped after doing a couple of pins to get confirmation from the group.

Many thanks in advance.
Paul, G0odp, Dorset, UK

The dot on the part for U9 should agree with the dot in the silk screen of the board. Yes, that CC5R on page 7 is upside down, the text of the reference designators in the drawings from the manual are unfortunately pretty much arbitrary. Use an ohm meter to find a ground pin if you have any doubts. The manufacturer's data sheet for any part will show the correct pin numbering, they almost always count up going counter clockwise from pin 1.

Many people have been incorrectly stating their second-run MTR serial numbers. What I have seen leads me to believe they are actually posting their second-run _order_ numbers. The serial number is printed on the paper sheet inside the parts bag.

My ATS-3 (original...not A, B, etc) has worked flawlessly since 2006. Yesterday during a SOTA activation it displayed the same symptoms as the post below from the February 2012 archives. KA2CAQ never got a reply that I could find but has anyone else seen anything like this?

Power plug inserted.
"ATS-2" announced (for 20m module)
Continuous dits until power plug is pulled.

TU for any advice or suggestions! (I fear a processor problem).

Bill, I had this problem with my ATS4b and what had happened is the paddle jack had rotated slightly in the case and when the radio got to hot (sun, use etc) it was just enough to short the wires against the case casing a string of dots until the power plug was pulled. I opened the case, moved the paddle jack a bit and all was well.

I hope it is that simple or you as well.

Hi Bill, Frank has seen it.. that piece of it.. if the nut on the jack works a tad loose.. the jack shifts and shorts.. The other option that may happen, is the jack gets broken, most of those jacks are "see in" or have a window to the innards.. close watching will show if it works like the audio jack... this may become helpful.. IF.. after removing the top, the same symptoms occur.Good Luck!!

I don't think it's a jack or connection problem. The ATS-3 jacks are soldered to the board and do not use nuts. I no longer use the key jack since I have an on-board paddle attached to the ATS case with leads tack soldered to the jack pins internally (so there's one less jack to fail with insertions). I checked the resistance from pins 8 (dash) and 9 (dot) to the MPS430 and both read the identical 47k. Closing the paddle results in shorts at the appropriate MPS430 input pins. So I'm afraid the problem may be internal to the processor.

Any other ideas? Steve?

Bill,
I assume you measured that 47K from processor pin to ground (actually the 3.3v rail, but ground is close enough when unit is powered down) on each of those two signals. Look directly on those two processor pins with a voltmeter after power up, should see 3 volts. Power down and check all the way around the processor for cold solder joints, push them with an Exacto blade to see if they move, maybe hit them again with a soldering iron just in case. If none of that helps (and you see 3 volts on both processor pins), you may have a blown input buffer on the dot pin and the chip needs to be replaced and programmed. Or you might possibly have a firmware bit that winked out and you just need to reprogram the MSP430, that's considerably less likely. (Good luck finding a PC with a parallel port.)

How can you loose a crystal? Use an odd one for the BFO, as that one doesn't need to be matched. Matched means I sorted 500 crystals into groups spaced 10Hz appart. A minimum of about 25 crystals are needed to match them that close.

How can you loose a crystal? Use an odd one for the BFO, as that one doesn't need to be matched. Matched means I sorted 500 crystals into groups spaced 10Hz appart. A minimum of about 25 crystals are needed to match them that close.

Yes the power-off resistance was measured from the processor pins to ground. I've also looked carefully around the processor and retouched pin 9 (dot side) with a soldering iron. With power-on I have 3.5V on the dash side but only 185 mV on the dot side. Since the pins look identical with power-off (i.e. no short from the processor pins to paddle input), I suspect the processor.

Meanwhile I got a note from Walter KA2CAQ who had the identical issue on his ATS-3A and he had to return it to Steve to replace his processor.

Unless someone has any better ideas I'm going to send it back to Steve so it's in his queue when he returns.

Look directly on those two processor pins with a voltmeter after power up, should see 3 volts. Power down and check all the way around the processor for cold solder joints, push them with an Exacto blade to see if they move, maybe hit them again with a soldering iron just in case. If none of that helps (and you see 3 volts on both processor pins), you may have a blown input buffer on the dot pin and the chip needs to be replaced and programmed. Or you might possibly have a firmware bit that winked out and you just need to reprogram the MSP430, that's considerably less likely. (Good luck finding a PC with a parallel port.)

One last suggestion before replacing the processor.
Try adding a 1K resistor from the dot line at the paddle
to the 3.3v power supply rail. With power off, measure
from the dot pin at the processor to 3.3v rail, should see
around 1k. Power it up, maybe the 3ma through that 1k
will be enough to overcome damage done to the IOBUF
of the MSP430 through static discharge or whatever.
If you are lucky.

11028. replacement capacitors- need info

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-15 21:47:08 UTC
From: tim_g4
Topic: 11028 Message: 11028

Hi All,
This troubleshoot my MTR. I'm going to try replacing some suspect capacitors next, but I don't know the voltage rating or tolerance of the ones used. I know its 0603 size and I need some 100pf's (violet) and .01uf's (blue).

For the .01's, I was looking here http://www.digikey.com/scripts/dksearch/dksus.dll?FV=fff40002%2Cfff8000b%2C340042&k=.01+capacitor&mnonly=0&newproducts=0&ColumnSort=14&page=1&stock=0&pbfree=0&rohs=0&quantity=0&ptm=0&fid=0

Look about right? Still need tolerance and voltage, though.

Thanks for the help,

Tim
K6TW

I think you want 0805's not 0603's.
The 25v 5% parts are good enough in most spots.
Transmit filters might best be 100v 1% parts.

Maybe you can borrow a capacitance meter long enough
to verify the ones you already have.
Or, post the symptoms, we might be able to help
narrow things down.

Voltage rating at C48, C69, C70 might want to be 100v as well,
I'm not sure I fully understand what all might happen there,
especially with a high swr.

11031. Re: How to check for key clicks

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-16 09:16:52 UTC
From: Yannick
Topic: 10997 Message: 11031

Hi,

This is a follow-up to my last questions.
With some advices from Jerry KE7ER I successfully had a measurement of the MTR keying shape and how my RX/TX Amp switching circuit was behaving.

First, this is not something new but the MTR has a very very nice keying waveform.
I uploaded pictures here :
http://groups.yahoo.com/group/AT_Sprint/photos/album/1197486776/pic/list

Raising and falling time are 6ms and very soft. Could not dream about better. Perhaps a bit long for HSCW, but this is not what the MTR was designed for.

The bad news is that my amp relay is way to small. I have uploaded a pciture to show the "bad example" but the shot is not as good as the other one.
Anyhow, you can see the beginning of the raising slope, then a blank (relay switching) then a very high level signal with a rounded edge (end of the raising slope).
That means my sensing circuit needs 2ms to detect the RF, then the relay 2ms to switch and I only have the last 2ms of the raising edge...

That's bad and that means key clicks. I will need to replace the relay as soon as I can find one beter locally.
All in all, I can live with it because "hot switching" at 55W is not that bad and I will not do QSK.
Looking at several QST reviews, that's also better that many commercial transceivers, so...

73,
Yan.

11032. MTR DEAD - no LED, no tones, processor issue?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-16 14:20:12 UTC
From: rasteenb
Topic: 11032 Message: 11032

I just finished the MTR and did the smoke test.
No joy.
I get a thump in the headphones when I plug the power in, but that's it.
LED isn't lit. No tones.

I checked the 3.3 and 5V regulators and they're providing the correct voltage.
I checked the other recommended connections in the manual and they appear O.K.

Voltages on U10 (MPS430) are:

P1=0
P2=3.3
P3=2.08* (side tone) Should be 0 according to chart
P4=0
P5=0* (OSC) Should be 2.7
P6=0* (OSC) Should be 1.7
P7-P14=2.5* (Tune, Dash, Dot, 7-SEG) Should be 3.3

P15-P18=2.0* (7-SEG) Should be 3.3
P19-P20=1.0
P21-P23, P26-P8=1.4* (RIT,MENU, Tune Up; DDS, DDS, Mute) Should be 3.3
P23-P25=0

I checked the connections to the crystal and they're good.

Any ideas?

Cheers,
Rob KA8JBY

P7 is the RST (Reset) pin, if it's not at or close to 3v3 then the
processor won't be running!

I just finished s/n 086. I thought that I did a good job soldering the parts (used solder paste). However, before I got it working I discovered one solderbridge and 3 cold soldered joints that looked good to my inspection.
I recommend getting a jewelers loope and examining every single solder joint for shorts. After that use an iron and resolder EVERY joint. At the toroids be sure you have a miniscus of solder on both sides of the PCB.
Recheck your resistor values and the orientation of the chips.
I was sure that I had a bad part but this is what worked for me.

How much current is the rig drawing? If it is above 35ma then you may have a short somewhere - I would get out the magnifier and check all the solder connections, especially the itty bitty ones... I know I had to go back and clean up a few "size of a human hair" type solder bridges that I didn't notice on first glance.

11036. Any requests for a demonstration video? And some initial impressions.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-16 15:54:23 UTC
From: mdweezer

I just received my MTR back from W0EA who did a wonderful job on my MTR build. It's a thing of beauty for sure!

I was going to capture a nice HD video of it in action. Any requests? Given the feature set, I can likely step through each feature and show it off. But if there's something specific someone can think of - I'll do my best to capture it.

As for my initial impressions - I powered it up with an old 9V I had on my desk. The MTR showed 8.1V. I tuned into the 4pm W1AW CW practice transmission and was quite floored at how quiet the RX is. I had my KX3 turned on as well and the MTR was a bit more quiet - though I contribute a part of that to the poor speaker on the KX3. But otherwise, very sharp tuning and filtering on the MTR. A quick CQ into a random wire (through a ZM-2 ATU) with the MTR showing 7.8V got me a handfull of spots on RBN. A quick check of power out via my dummy load showed around 1.5W.

The single digit display is very bright and looks great, and the sidetone is quite pleasant. I'm using a mini USB powered capsule shaped speaker.

I'm debating swapping out the RCA connector for a BNC, though for now an adapter does the trick. I can definitely see the desire for a power switch of some sort with an internal 9V battery. The barrel connector is pretty tough - no chance of it slipping out.

Features like DFE work as one would expect and allow for very fast QSY'ing. Everything becomes second nature very quickly as you begin using it.

That's all I've got for now. I hope someone finds this useful or enough to hold them off until they get theirs built and on the air.

Tnx TJ,

I was looking for a very small switch in all case. But I don't know if I will drill the box. Maybe I will remade the bottom part of the box in translucent plexiglass, it could be beautiful and drilling this one does not tear my heart.
The Matt's video will helps me to decide.

Loïc.

Thanks for the tips.

The rig is drawing 27ma.

I found one solder bridge so far on U3 (LM4808).

I checked the voltage at pin 7 (reset). It is indeed 2.5V and upstream, on the other side of R22, it's 3.3V.

I'll keep looking and re-soldering.

rob

I tried a test run in my toaster oven with the suggested temperature and time scenario and had poor results. I used a scrap pc board with MG Chemicals Soldering Flux, No Clean Paste, 10ml syringe that I purchased from Mouser. Is this the wrong stuff???

Don't know the usage profile of what you bought, but best results can be had by using Kester Easy Profile 256. Cash Olsen is a great guy to get it from.

I believe you got the wrong stuff .. there's no solder in that, it's just flux paste! Go with Mike's suggestion, the 256 works great (I've been toasting boards for a couple years now)

Colin...my first run MTR had no audio tone. Someone suggested taking my headphones and a couple of test leads.....hook one test lead to the phono plug and hook it to ground on PCB. Take the other test lead hooked to the phono plug and clip to a piece of component lead you've snipped off and use it as a probe. Touch it to the bottom of R28 and power up the MTR.... if the processor is working you'll hear a faint CW band enunciation in your phones. If you hear audio your problem is somewhere downstream in audio amp circuit which was my problem.
My LED display began to light on power up but quickly dimmed and went out looking like a short! My 9v battery had dropped to 6v with all my poking around looking for my problem and the MTR was shutting off! Whats your test battery voltage?
Good luck...the MTR is a great rig!

Just an FYI ...be advised both the key jack and heahphone jack do not ground themselves when installed in new case. I installed my MTR1 in the new MTR2 case and wired everything up thinking "nah, I don't need to run an extra ground wire the chassis will take care of that" Wrong!

Not so. Donno if it's the paint job that insulates the jack's sleeve from ground or what? I had everything installed and fired the radio thinking I was through ...it wouldn't key and I heard no audio? Doh! Ohm'd the jacks and they were both ungrounded! installed a ground lead and everyone is happy!

The antenna jack, however is. And if you've looked at the gen 2 board (at least the one I have seen) the ground connection for the antenna is masked over so you can't solder to it anyway. You could run a little wire from the standoff post to the ground on the RCA but in my testing it was not needed.

Rob....thought I'd mention one more tip...perhaps it's been mentioned already? If you are lacking in magnification power to inspect your soldering a digital camera set on macro mode works well. Take lots of jpgs with light from different angles and then pull them up on your PC. Now you can zoom in with a full screen....sure helps with looking for bridge shorts between the pins on the chips!

Thanks for the info Steve ...
Will take note of your observations whilst installing the unit in the case.

Nice Ultra lightweight SOTA setup in your photo.

I've just finished building MTR2 #261, initial bench testing looks good. 3w on 20M and 1.5w on 30m @9v without any toroid tweaks.
Next job is to optimise followed by calibration.

Hope you're ready for a transatlantic MTR S2S attempt soon. :-)

Rob,

Debug can be exasperating. The important thing is to keep trying stuff. Let us know if you make any progress.

Colin is right, the RST signal at pin 7 should be 3.3v. No good reason for it to be stuck at 2.5v. But according to page 22 of the data sheet at http://www.ti.com/lit/ds/symlink/msp430f2132.pdf it need only be as high as 0.75*3.3 = 2.48 volts worst case to be seen as a high. Could you measure that one again?

I think seeing 0 volts on XOUT might be the bigger clue. Should be an analog output from the processor to drive the crystal, and my voltmeter sees 0.34 volts there at power up whether or not I have RST grounded. Perhaps XOUT is shorted to ground, or some other nearby copper like XIN? Maybe you have a bad crystal? (There's a spare 32 KHz crystal shipped loose with each MSP430 launchpad.) XIN is a high impedance input to the MSP430 and has no DC path through the crystal, so voltage readings on XIN tend to wander. Both XOUT and XIN are several megaohms to ground on mine, measured with power off. So use your ohm meter to see if XOUT and XIN are shorted to something.

The only pins that should matter much in getting the MSP430 to sit up and talk are pins 1,2,4,5,6,7, for TEST, 3.3v, Ground, XOUT, XIN, RST. All the other pins are just peripheral port IO, they shouldn't kill the processor. I can believe they might float to 2.5v if the processor hasn't initialized them yet.

For those that are curious, more information about how TEST and RST are used is found on page 7 of
http://www.ti.com/lit/ug/slau320i/slau320i.pdf
TEST is always an input to the MSP430, gets used to clock JTAG data bits in and out of the RST pin under spy-by-wire when burning internal flash from the Launchpad. The JTAG data bits on RST are just a repeating pattern of the standard JTAG signals TCK, TMS, TDI, TDO.

I suppose you've checked the MSP430 pin 1 orientation dozens of times. The corner dot should be nearest the headphone wires.

Note that the MTR schematic says 32.578 KHz on that crystal, which is wrong, parts list has it right with 32.768 KHz. But the parts list incorrectly shows 4.5912 MHz for the IF filter crystals, the schematic gets that one right with 4.9512. Dividing 32768 Hz by 2**15 with a ripple counter gives one second, those crystals are used on watches and timers. A 4.9512 MHz crystal was often used as a microprocessor crystal since divided by 2**9 gives 9600 baud for a UART. Distributors keep gazillions of both in stock.

11058. L5,L7 L4,L8 in MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-18 15:08:07 UTC
From: Joseph Trombino, Jr
Topic: 11058 Message: 11058

Howdy gang:

I'm about to mount L5,L7 and L4,L8 in my MTR and believe there is a mistake(s) between the schematic and listing for bands on page 11 of the manual.

BN1 is supposed to be the higher frequency band and BN2 is the lower frequency band.

On page 11 of the manual lists BN1 as L5, L7 and BN2 as L4, L8....that would infer that L5, L7 are for 20M and L4, L8 are for 40M.

However, these are reversed between page 11 and the schematic...on the schematic L4, L8 are for 20M and L7, L8 are for 40M.

Can somebody give me a sanity check on this??

I'm gonna assume a mistake was made and use L4, L8 for 20M (8.2uh) and L7, L5 (18uh) for 40M.

73, Joe W2KJ
I QRP, therefore I am

I don't have the manual in front of me, but yes, the band select resistors (BS1 and BS2) are in order, Higher band on BS1, lower band on BS2. This is opposite of the filters as you've noted. Follow the instructions as they're written, and you'll be fine.

TJ...the instructions appear to be incorrect..that's my concern.....on page 11 the instructions call for lower inductance coils for the lower band and higher inductance for the higher band...don't believe that is correct.

Could the confusion be around the meaning of the term 'higher' ?? Is it higher in frequency or higher in wavelength?

as you are looking at the board with the coils in the lower right corner, the 20m (or higher frequency parts) are on the left, and the 40 (or lower freq parts) are on the right. The values are correct, I've built 3 of them this way so far.

I don't know about the current run of boards, but on the first run the silk legend of "BNDA" and "BNDB" near the RX trimmer caps should be reversed. As noted in message 8739 and several times since by others.

Perhaps you have found some other inconsistency. Exactly what disagrees with what?

It is higher in frequency...i,e., 14Mhz for band 1 and 7Mhz for band 2.

11065. [SUCCESS!] Re: MTR DEAD - no LED, no tones, processor issue?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-18 16:40:53 UTC
From: Rob Steenburgh
Topic: 11065 Message: 11065

Thanks again to everyone who replied offering advice and encouragement! That made all the difference. I was beginning to think I'd never get it working.

(I had to take a break from the rig for a bit; troubleshooting is indeed exasperating and I've found that frustration typically leads to more mistakes and bad decisions.)

Today, after reading all the replies, I went back to the bench.

I swapped the xtal out with the extra from an MSP430 launchpad (thanks Jerry); no change. Then, I went back and revisited every solder joint. It appeared on some chips that I didn't use enough solder paste. These chips seemed to have a pin here and there that was dry. So I made sure they were all soldered.

When I plugged in the battery again, I had a hiss in the headphones but still no beeps.

Did another go-around on the MSP chip to clean up the joints; turns out I had made a bridge when I re-soldered it.

I removed the solder bridge and shazam, it worked! ITS ALIVE!

I get a brief 4 on the display, the Morse code equivalent in the headphones, and then the decimal point on the display. Woo Hoo!

Now, I know there is still more to do to get the rig on the air, but this was a big hurdle.

Thanks again and hope to have this beauty on the air soon.

73,
Rob KA8JBY

Rob-
Sounds like you are making progress, don't give up.
I scored a nice used Bausch and Loumb stereo microscope on an auction site, it has been great for examining boards.

No sooner had I posted my query Paul, when I received mine as well- typical- and the customs fee was a nice surprise!
Good luck with the constructon. I wonder what wattage of soldering iron and what size of tip you and other members of the group use for this kit. My iron has a tip temperature of 420 C, is this too high?
I am a complete smd virgin and would appreciate any advice.
If I make a mess of this I'll cry like a baby!
Thanks for your reply Paul.

Best wishes
Martin

11071. Re: L5,L7 L4,L8 in MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-19 06:48:50 UTC
From: jgaffke
Topic: 11058 Message: 11071

Joe,

My apologies for dismissing your complaint. I built a first run board, the build instructions for band specific parts were much clearer in that manual. For what it's worth, my stock build first run has L4,L8,L12,L13 stuffed for 40 meters, those are all near the edge of the board and labeled BN2 on page 11 of the second run manual build instructions. The switches get pushed left to select 40M.

The schematic in the old manual shows the filters correctly, calling out the correct inductor reference designators for the two bands exactly as I built my MTR. The new manual incorrectly swaps the schematic reference designators for the RX filter parts, but not the TX filter parts. I think L4,L8,L12,L13 should all go with Band 2, and I suggest Band 2 be stuffed for 40 meters. This agrees with how the first run MTR's were built, and agrees with the statement on page 8 that states "Make BS1 highest freq band".

Correct the schematic in your second run manual (in the files section, MTR_2.pdf in folder MTR) by swapping designators L5,L7,C25,BNDB with L4,L8,C26,BNDA at the bottom left of page 22.

As Steve points out in message 10863, it doesn't matter which band is where. His intent was to use the side with the shorter board traces for the higher frequency band, but the traces are all just a fraction of an inch long anyway.

Very confusing.
Jerry, KE7ER

I built my MTR according to schematic on page 22, so you are saying this is incorrect? What problems will I have if this is incorrect?

> My apologies for dismissing your complaint. I built a first run board, the build instructions for band specific parts were much clearer in that manual. For what it's worth, my stock build first run has L4,L8,L12,L13 stuffed for 40 meters, those are all near the edge of the board and labeled BN2 on page 11 of the second run manual build instructions. The switches get pushed left to select 40M.
>
> The schematic in the old manual shows the filters correctly, calling out the correct inductor reference designators for the two bands exactly as I built my MTR. The new manual incorrectly swaps the schematic reference designators for the RX filter parts, but not the TX filter parts. I think L4,L8,L12,L13 should all go with Band 2, and I suggest Band 2 be stuffed for 40 meters. This agrees with how the first run MTR's were built, and agrees with the statement on page 8 that states "Make BS1 highest freq band".
>
> Correct the schematic in your second run manual (in the files section, MTR_2.pdf in folder MTR) by swapping designators L5,L7,C25,BNDB with L4,L8,C26,BNDA at the bottom left of page 22.
>
> As Steve points out in message 10863, it doesn't matter which band is where. His intent was to use the side with the shorter board traces for the higher frequency band, but the traces are all just a fraction of an inch long anyway.

Hi Joe,

I had already composed an email to respond to you and was assuming that the schematic is correct. Then, I saw Jerry's email and tossed what I wrote. How about this for a bottom line for you?

When it comes to the RX Bandpass Filters and the TX Lowpass Filters, as TJ pointed out, install the 20M components closer to the middle of the board and the 40M components closer to the edge of the board.

We know this also because the photo of the MTR on page 1 of the manual shows the band switch to the right (towards the middle of the board) for 20M. So we just need to remember, 20M towards the middle and 40M towards the edge.

Also, the related capacitors for the RX Bandpass Filters, on the one hand C25 and C26, and on the other hand the Band trimmer capacitors, are of equal value for the 20M and 40M filters. So you cannot install these in the wrong position.

Therefore, as you said in your first post, put the 8.2uH coils for 20M in the BN1/L5,L7 locations on the board illustration above the table on page 11 and the 18uH coils in the BN2/L4,L8 locations.

Earle
AB6WL

P.S. For anyone who might be interested, below are plots for the two Bandpass Filters and for the two Lowpass Filters --

MTR 20M RX Bandpass Filter

Ron,

Yup, I'm saying the schematic on page 22 is incorrect.
Of course, it was very late, and I've been wrong before.

Builders that followed the build instructions and
made self consistent choices for Band1 and Band2
should be fine. It's OK if Band1 is 40 meters,
but most builders are making Band1 20 meters.

If you followed the schematics while building (hey, you're
thinking too hard!!), you probably want to swap L7 with L8,
and L5 with L4.

If you don't do that, you may have trouble getting the
receiver to peak on the desired signal. That might be
difficult to know since those trimmer caps have no stops
at min and max. What you might think is a proper peak
on 40 meters could turn out to simply be the trimmer cap
at its maximum value.

I suggest you flip the switches to the 40 meter side, then
follow the traces to see which receive filter inductors
are connected in. If built correctly, the color code
should be brown,gray,black,gold for 18uH on those two
inductors. The 47k band select resistor for 40 meters
should also be selected by switch S5.

On a related note, in message 10988 I suggest you add 100k
0805 resistors over the top of any 47k band select resistor
for 40 meters and 100k over the top of any 22k band select
resistor for 30 meters. Those resistors are at R3 and R4.
Most builders are not having trouble with the MTR as kitted,
but some are. Especially those with other than the standard
20/40 meter band selection.

Only the schematic in the second run manual, found in the MTR folder of the files section under MTR_2.pdf is incorrect. The first run manual (for kits sent out in 2012) in MTRmanual4212.pdf is correct. The two boards have significant differences, as pointed out in message 10879

11080. MSP430 for the ATS-4B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-19 21:38:38 UTC
From: ab6wl
Topic: 11080 Message: 11080

Hello All,

The parts list in the manual for the ATS-4B indicates an MSP430F1232DW. The schematic shows an MSP430F1231.

At the DigiKey website, I found these options--

MSP430F123IPW (Slope A/D Data Converter)

MSP430F123IDW (Slope A/D Data Converter)

MSP430F1232IPW (A/D 8x10b Data Converter)

MSP430F1232IDW (A/D 8x10b Data Converter)

Which is the one for the ATS-4B?

11081. MTR #171 up and running

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-19 22:49:16 UTC
From: Joseph Trombino, Jr
Topic: 11081 Message: 11081

Howdy Gang:

In spite of myself (and the errors on the board and the manual) I got MTR s/n 171 up and running FB.

Love the little case....much better than an Altoids tin...nice job on that Steve, KD1JV.

Unit fired up and all the smoke stayed in the parts (grin) calibration went without a hitch and front end aligned up easily with my HP8656B sig gen.

This is gonna be a sweet little rig to take to the field...will give my KX3 some rest time and the MTR will play just fine with my PAR EFHW for 40/20/10M.

I keep saying I will never again build and SMD kit...these 68 year old eyes sure needed some help from my OptiVisors...but if Steve ever comes out with another run of the ATS4B I will probably break down and give it a try.

Wish I could say I have taken to these little parts...just don't sneeze around them and all is fine!!

Now to get out to the field for some fun with the new MTR.

73, Joe W2KJ

I don't have an ATS-4B, but you can almost read the print
on the MSP430 shown on page 11 of the ATS-4B manual.
Looks like "M430F1232". The pin spacing is the same as the
74AC02, so it's the 28 pin DW package. My MTR has the
smaller 28 pin PW package, same pin spacing as the ADS9834.

I couldn't find an MSP430F1231 mentioned on the TI website.

Check out pages 2,3,47,51 of the TI MSP430F1232 data sheet:
http://www.ti.com/lit/ds/slas361d/slas361d.pdf

My guess is you want the MSP430F1232IDW, and that the
missing "I" simply indicates Industrial temperature range.
As opposed to the wimpier Commercial temperature range
which is not available on this part.

Good luck programming it. I think you will need the old
parallel port programmer, and that USB to parallel adapters
won't work.

Topic: 11084 Message: 11089

Hi Bob,

I finished building my 30m/20m MTR last Sunday but I've only tried it out for the first time today.

The rig works FB. I worked N1EU and W4ZV on 30m this morning from northern England.

If you build the rig as directed by Steve's instructions in the build manual you should be ok. Build as per 40m/20m but swap out the 40m parts for the 30m parts.

As noted earlier in the group, looking at the board with 'Mountain Top'er' the correct way up, the 20m RX inductors and TX toroids are fitted towards the middle of the board -Band 1 and the 30m RX inductors and TX toroids are fitted towards the edge of the board - Band 2.

The only 'mod' needed was to change the 30m band select resistor for band 2, R4 towards the right edge of the board from the supplied 22K to 18K, this gets the band select voltage more into the range that the processor is looking for.

I know of another successfully built 30m/20m MTR and this rig also uses an 18K band relevant resistor for band 2.

So yes, it has been done successfully.

hi gang, this is my first build and go figure... no joy when power applied. no sound and no leds. so i did a once over for solder joints and they look good but i will do a secondary to be positive. i do hear something in the headphones when i apply battery but nothing more than what sounds like the battery being connected.
so here is my question. i am not an engineer so i dont have alot of test equipment to aide me in troubleshooting. i do have a digital meter.

the first thing the troubleshooting asks you to do is check for shorts across dc in (i know where that is) +3.5 and +5 regulators to ground (dont know where those are) can someone tell me were to test for this? thanks

James,
Look at the schematic on page 22 of the MTR_2.pdf file in the MTR folder of the files section of this group. U7 is the regulator for 5 volts, U4 is the regulator for 3.3 volts. To measure the 5 volt supply, put the black probe of your voltmeter into one of the four corner holes (they are connected to ground), and probe the plus side of C20. Measure from the plus side of C37 to check the 3.3 volt supply.
Most problems with bringing these rigs up come down to trouble with soldering parts to the boards. Inspect everything as closely as you can, a binocular microscope is ideal, some strong drugstore reading glasses and a very bright light are almost good enough. Look for shorts, which could be just a spider's silk thickness of solder between two adjacent pins, though more likely a big glob somewhere. And look for cold solder joints, where you might get solder on the pin and solder on the pad, but they are not soldered together. I push at the pins with the tip of an exacto blade to see if they move when looking for cold solder joints.
You will need to get the processor up to where the LED lights up before much else will happen. The processor needs to initialize the AD9834 DDS chip to get the local oscillator going before you will hear any signals in the receiver. See message 11056 for a discussion on getting the processor going.
Good Luck!

Please be sure to only touch one pin at a time on the voltage regulators the input and output are next to each other and if shorted the 12 v will blow all the chips fed by the regulator.

The consensus seem to be that R4 needs to be replaced by an 18K to switch properly.

Does anyone have an easy source where I might obtain this one resistor without the minimum order requirement?

Mouser would be happy to sell you one for a nickel.
Course, they might want $10 for shipping.
Perhaps somebody's willing to buy a couple dozen each at 18K,
33K and 100K, then ship them around for the price of an SASE.
See messages 10992 and 10988.

I think Radio Shack now carries some 1/8 watt (leaded) resistors. Is there room for one of those? If they don't have 18k, use 100k in parallel with the 22k SMD you have.

I started building my MTR a few weeks ago and my 9 year old soldering station gave up the ghost. I'm now ready to go again but in the interim I see there have been several documentation issues discovered in the most current manual (dated 2 April 2013). Before I begin again:

1. Steve, will there be a second revision of the manual beyond the current one?

2. If not, has anyone kept track of the issues? Before I go through all the posts myself, has anyone already done this that would share their list?

I am having similar issues too. When checking for short, I am getting about 62 ohms at C20 and c37 is zero. I figured this may be okay, so I applied power and U7 gets rather warm/hot rather quickly.

Should C20 be zero ohms? What kind of hear can I expect U7 to dissipate?

I thank you in advance.

To measure the 5 volt supply, put the black probe of your voltmeter into one of the four corner holes (they are connected to ground), and probe the plus side of C20. Measure from the plus side of C37 to check the 3.3 volt supply.
> Most problems with bringing these rigs up come down to trouble with soldering parts to the boards. Inspect everything as closely as you can, a binocular microscope is ideal, some strong drugstore reading glasses and a very bright light are almost good enough. Look for shorts, which could be just a spider's silk thickness of solder between two adjacent pins, though more likely a big glob somewhere. And look for cold solder joints, where you might get solder on the pin and solder on the pad, but they are not soldered together. I push at the pins with the tip of an exacto blade to see if they move when looking for cold solder joints.
> You will need to get the processor up to where the LED lights up before much else will happen. The processor needs to initialize the AD9834 DDS chip to get the local oscillator going before you will hear any signals in the receiver. See message 11056 for a discussion on getting the processor going.

If you are saying you used an ohmmeter across each of those capacitors to ground- then no, neither cap should read "zero ohms" or a dead short. If you read a short circuit across C37, then you probably have a short somehwere from your 3.3 v rail to ground. No, the regulators should never get hot. Remember, the entire rig only draws a few dozen mA on receive.

With rig powered off, I see around 12k across C20 and 60k across C37. May vary considerably with meter used and range it is in, but should be several thousand ohms. Get out the magnifying glass, you most likely have more than one solder short.

From: rasteenb
Topic: 11105 Message: 11105

Once I got the solder issues fixed and the MTR sprang to life, the remainder of the testing and alignment went without incident.

Today I made my first and second contacts on 20M.

RU27LU using the MTR, the WA2EUJ 50W Amp, and a vertical.
AH6LV using the MTR and the vertical.

I'm getting about 3W out with 8.5V.

Now I have to pick a mountain to climb that's within my capabilities. I am also thinking of getting a collapsible fiberglass pole to put the EFHW on.

73/72,
Rob

11108. Another MTR lookin' good #248

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-24 19:42:28 UTC
From: pswarman
Topic: 11108 Message: 11108

Starting with my mistakes (now corrected)!
- U9 wrong way round.
- C37 electrolytic wrong way round (dumb or what!).
- U9 pin2 not soldered to track.
- Stood the electrolytics upright instead of on their sides!

Now the receiver is working great, receiving sub-microvolts from genny and picking up some traffic on the band.

I need to parallel that 100K resistor across BS2/R4 for 30mtr operation and then tighten up the calibration and fingers crossed another one on the air.

Thanks for the helpful postings fellas, I've followed them all.
Paul, G0odp, Dorset, UK

Good, at least I'm not the only person who's having difficulty with this chip. The dot identifying pin one is microscopic. But for my chip the above worked, pin 1 is under the first C of CC5R.
Looking up the pdf specifications didn't help!

I hope this is useful.

I am assuming you are talking about a second-run MTR kit, as that has been the bulk of the list traffic lately.

Follow Steve's advice in the instructions. There is a dot that marks pin 1, but it can be hard to see. A strong light at an angle and magnification will help. Also, if you orient the chip with the writing (CC5R) upside-down, pin one will be in the upper right hand corner.

I get about 3 watts from my AT-Sprint with 9 VDC (nominal) power supply. The design has been changed slightly since 2003, but you should get about the same power on 20 as on 40. Tweaking the inductors is a good start.

Same on mine. 4.5W on 40m and 3.3W on 20m (at 11V). I haven't bothered to look into it yet, because it works fine anyway. I had a 5200 miles QSO on 40m using 1.3W (I had swapped two capacitors).. So anything above 3W is good for me.

Gil.

11121. another MTR report

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-25 13:04:44 UTC
From: cloud runner
Topic: 11121 Message: 11121

Two things of possible interest to others ...

Thing One:

I am getting 5 watts output on both 20 and 30 meters, at eleven volts.

But, I only get 5.5 watts out at 12.5 volts.

The efficiency diminishes rapidly above 11 volts, and for my radio at least, and probably others, is not worth running over eleven volts, mostly inceases heat output, not RF output.

Thing Two:

Operating in the field, I had turned on the RIT. then I attempted to change bands with the switches.

Let it be known, you can't do that ;-) It stayed on the previous band. Also,

I did not study what was going on exhaustively, but, I returned the radio to its normal mode, and still could not get it to change bands. I finally disconnected the power, in other words, did a reset, then i could change bands fine.

no. I think it has to do with the firmware, getting itself in a position from which it can't recover.

The efficiency at any voltage can be adjusted with the output filter. I have my AT-Sprint optimized for 9 volts (nominal). All it usually takes is a bit of tweaking ofthe inductors between the PA and the transmission line to the antenna or tuner.

I figured that the small amount of extra powerat 12 VDC, plus the need to be very careful about feeding a matched antenna because of possible frying of the output transistors, that it didn't make sense to optimize for 12 VDC.

From: jgaffke
Topic: 11121 Message: 11125

There's a lot I don't know about RF amps, but I would expect the output power to go up with the square of the voltage source. Output power would also be inversely proportional to the impedance presented by the output filter to the FET at the target frequency. Of course, real FET's have losses that increase with power, and at some point that SWR protection zener will kick in.
In the files section under KE7ER, I've posted mtr40irf510.asc, an LT-Spice schematic with DC bias at the FET gate to drive an IRF510, but otherwise the same as the MTR on 40 meters. Output at 24 volts is very nearly 4x the power at 12 volts. I haven't tried building it though. Output filter might have to be beefed up some (voltage across caps, current through inductors).
Jerry, KE7ER

That transmit filter is a low pass filter. If tweaking the coils raises the output power, I'd bet it's a matter of raising the corner frequency (by reducing the inductance).
Also, if you were to try an IRF510 at 24v as suggested previously, you would more than "might" want to beef up those output filter components.

I gladly receiverd my MTR kid today. Steven, thanks a lot for everthing!

Customs were passed without problems. DHL organized everything. I had to pay almost 9 Euros tax.

Assembly will have to wait because of QRL. As I just finised the ATS-3b, which by the way is great fun, I need not hurry.

Are there other hams in the German language area who build this kit -welcome for exchange of experiences.(Gibt's im deutschsprachigen Raum noch andere MTR-Bastler - bitte Rueckmeldung für Erfahrungsaustausch!).

I'm pretty sure it's a 50 ohm in/out low pass filter with a harmonic trap. That's the function of the capacitors across the coils.

I found that compressing the wires so they were denser around the top of L10 gave a far higher output. Is this because I didn't wind the toroid tight enough?

Bunching up the wire on L10 so that it's denser at the top yields a significant increase in output. Is this because I haven't wound the toroid tight enough? Am I changing the filters properties to the detriment of some other variable?

11138. MTR2 Power Output

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-28 16:02:12 UTC
From: jonesr_99
Topic: 11138 Message: 11138

When testing my completed MTR2, I had 5+ watts out on 40mtr with a 12volt supply, but only 2 watts on 20mtr. I tried bunching and spacing the turns on L10 and L11, but that made no difference. I rewound L10 with 10 turns, and that lowered the output to less than 2 watt. I then rewound L10 again with 12 turns, and that made the difference, I now have 5+ watts out on both 40 and 20. It worked for me, your results may be different.

Very interesting, Ron.

Theoretically, using the Toroid Inductance Calculator program by K1QW at http://lcbsystems.com/InduCalc.html you increased the inductance of L10 from 520nH to 619nH. Then, using TINA to model the whole 20M TX Lowpass Filter, you pushed the -3dB point out from approximately 14.25MHz to approximately 15.1MHz, thus, making it very possible that you moved your operating frequency off the downward curve of the Lowpass Filter to the portion just before it turns down, even giving yourself around 3dB of extra power out, i.e., twice the power out than before. This seems right in the light of your measuring an increase from 2 watts to 5 watts.

Am I looking at this whole thing correctly, everyone?

And, Ron, did you get a chance to measure the inductance of L10 with both 11 turns and 12 turns before you installed it, because I find all the time that the actual inductance can vary quite a bit from the calculated inductance. BTW, I use an L/C Meter IIB by Almost All Digital Electronics at http://www.aade.com/lcmeter.htm

It would be interesting to know exactly what inductance Steve had calculated for L10 and that 11 turns of a T30-2 powdered iron toroid is therefore supposed to produce.

11145. KK5PY Micro Paddle - a few left

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-04-29 14:46:12 UTC
From: Etienne Scott
Topic: 11145 Message: 11145

(Pardon the cross posting - I wanted to give the AT-S and MTR folks a chance at this.)
Dennis-KK5PY has a few of his micro paddles left - no more parts means that this may be the last. With the attached cable it weighs in about 1/3 of an ounce and the paddle and cable fit easily into a 35mm film canister.

He is selling his micro paddles for $40 plus $5 for US shipping. I've been trying out paddle #17 and used it during QRPTTF. You hold it with the fingers from one hand and operate it with the lightest touch from the other hand. It is well made and travels best in its film canister.

Short clips of micro paddle with MTR - http://www.youtube.com/watch?v=rKTjC_yVXBw
Historic reviews here: http://www.eham.net/reviews/detail/1761
http://qrp.kd4ab.org/2001/010812/0002.html
Find a photo here: http://www.njqrp.org/keys-paddles/
Another photo here:
http://www.pnwsota.org/blog/k7atn/2013-april-15/spencer-butte-or-apr-2013

You can reach Dennis at kk5py (at) neok dot com

He may do PayPal - check with him first.

Dennis Foster - KK5PY
300 N Maple Ave

11147. KD1JV Hike Update

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-01 18:10:44 UTC
From: tzmitch
Topic: 11147 Message: 11147

I ran into Steve this afternoon at the Nantahala Outdoor Center on the AT near Bryson City, NC. That puts him almost 60 miles into North Carolina and he has a pretty mean climb up to Cheoah Bald before the day is through. Certainly seemed to be enjoying himself and was fixing to dive into one of the big burgers they have at the restaurant there. We explained ham radio and SOTA to a bystander.

You may have to translate that phrase for northern readers.

Google translates "fixing to" as "getting ready to" in Southern.

73, y'all.

11156. KD1JV Hike Particulars?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-02 16:56:03 UTC
From: Hank Greeb
Topic: 11147 Message: 11156

I must have missed something. Even a search back to early April in this forum I can't find any info on where Steve is/was intending to travel along the Appalachian Trail. Anyone know more details?

Note that I'm not about to try a hike on such a trail. I'm up to about 2 miles every other day along the quite flat Fred Meijer White Pine Linear Park Trail which is built on a former railroad bed. Maximum grade is something like 3%, and most of the time the grade is <1%. A few years back I routinely did 6 miles or more every other day on this and similar trails, but I sloughed off during the winter of 2011/12 and my legs don't work all that well any more.

I do like to take my AT-Sprint (original version) and set up along the trail. There are plenty of "naturally occurring antenna supports" along the trail, and many parts have beautiful scenery, even close to civilization of cities and towns.

I surely admire the folks who travel along the "major" trails like the Appalachian trail, etc.

I don't know if Steve posted it on the list or not, but he'd sent me a message on Facebook a couple months back, and is periodically giving updates on his FB page. Actually, though, I think he did mention here on the list that he wanted to get the MTRs out before he went on his hike.

Basically, he set out from Springer Mtn. on about 4/17 and is looking to put in about 500 miles.

11161. MTR_2 SN/292 PCB errata at L12 land

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-03 01:17:08 UTC
From: jr1kda_ag6gt
Topic: 11161 Message: 11161

My MTR_2 SN/292 PCB has one errata at L12 land.
I post three photo about this errata in Photos named "MTR_2 SN/292 PCB errata at L12".

When I finished to build my MTR, I tried to check and test. After checking my MTR, I tried to send CW signal. But I got no signal on 40m band. Also I checked 20m band. MTR is sending 20m band signal with 1 watt at 12V. I check the out put filter circuit. I found that out put line is connected to the ground.

I dismount L12, C57 and C75. But there is still short circuit. Finally I found the PCB errata about L12 land. You can see two photos in Photos area.
http://xa.yimg.com/kq/groups/18035723/sn/1409089619/name/Image1-c.jpg
http://xa.yimg.com/kq/groups/18035723/sn/1103280809/name/Image2-c.jpg

I repair the PCB errata.
http://xa.yimg.com/kq/groups/18035723/sn/1093645159/name/Image3-c.jpg

I rebuild the out put filter circuit for 40m band.
I got the out put signal from MTR on 40m band.

I think for low out put from my MTR at 12V.
Perhaps some BS170s was died when I send the signal on 40m band first time.
I already order new BS170 at online shop. I will replace the all BS170.

Yes, the Appalachian Trail DOES seem to be an achievement to do.
Unless I am wrong, it does also tend to be something that is so draining that Steve might not be using his own radio gear on this kind of hike - reserving activity for less straining hike closer to home?

As an aside, I have hiked some some small parts of the AT. It DOES interest me and I do hope to do a good part of it after I retire from the first career.
I've read a number of books on doing the AT - a blind fellow with his guide dog; Bill Bryson's book (he was HARDLY prepared for it); Dennis Blanchard's book (300 Zeroes) on his hike/ham radio (he had to stop for a while and do recuperative heart surgery and then return to the AT healthier and lighter).

Up hereabouts we have the Bruce Trail... which is 560 miles long
and is a UN Bioheritage Site.

http://en.wikipedia.org/wiki/Bruce_Trail

I hike it quite a bit in sections, but usually only day hikes for now and with the dogs and 8 year old niece and wife, so no ham radio. But I will be trying out some hiking/SOTA ideas for future endeavours this summer and might us the Bruce Trail for some of the testing.

enjoy and be safe outdoors

"You all" may celebrate as you choose!

Ten years ago Steve showed me the original, it was a Hosstraders day, NEARfest now, same day that the Old Man In the Mountain fell (may he rest in pieces...) Source/inspiration for the original were surface mount parts that came from satellite TV boxes fished out of the trash when one company bought out another and all the subscribers boxes got replaced.

Its been fun and the time has flown.

I visited Steve in Berlin a day or two before.

I still have my first ATS in an Altoids, if you are interested in it contact me off list.

He reported to another guy and me that he doesn't have a radio since that leaves more room for Snickers bars. Priorities….

Shall we schedule an "Original AT-Sprint" QSO Party)? Lessee, everyone with a rig designed by Steve gets a multiplier. Everyone astuteenough to have one of the 50 or so "Original AT-Sprint" versions getsanother multiplier (larger). Folkswho went out on a trail would getabonus multiplier. Folkswho took their original AT-Sprint out on a trailwould get a million point bonus in addition to the bonus multiplier. All the otherswould be welcome to jointhe fracas, but receives a multiplier of zero or-1 (negativeone) :)

Sorta like the QSO Party after the 2006 (or 2007) FDIM where we folks who were brave enough to make a 300 milliwatt transmitter got on the air one afternoon for a couple hours and tried to contact others with the same rig, and answered folks who were calling us.

The "Original AT-Sprint" QSO Party" would bea low key event, wemight even take a hint from WB3AAL and his "Grizzly Polar Bear Organization," and take pictures of ourselves eating salmon sandwiches and posting them on the "Original AT-Sprint" QSO Party" web site, wherever that might be.

11172. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-04 02:31:18 UTC
From: NAQCC
Topic: 2848 Message: 11172

NAQCC Sprint Wednesday night!

Last May we had one of only two sprints with under 100 logs submitted in the past three years. That was due to many members heading off to the Dayton Hamfest. So this year to avoid that, we are having our May sprint the week before Dayton as we hope to continue our long run of 100+ logs sprints to show the ham radio world CW is alive and well - and actually growing. That means our May sprint will be on a second Wednesday instead of a third Wednesday.

Our May sprint is this coming Wednesday evening local time (May 8, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Thursday May 9, 0030Z to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201305.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prize page on our website.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6680+ members in: All 50 States - 9 VE Provinces - 93 Countries. Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

11173. 20mEFHW with 40mGP Option

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-06 01:55:23 UTC
From: steve_wg0at
Topic: 11173 Message: 11173

I've been wanting a 20/40m antenna combo for my 20/40m MTR-one that would be easy to deploy and easy to switch bands. First thought was to use simple liked dipoles which still might be a good solution.

But recently I've had great results with a 20m EFHW using a simple fixed tuner 90:1 balun basically a LC network. After sharing some ideas with friend Fred/KT5X who had modeled adding the 40m radial to the 20m EFHW to create a 40mGP ...said it might have some interesting possibilites. So I decided to try it and built one! ...and it worked!
